How to Stop Being Scared or Shaken Out Of Winning Trades

By Chris Vermeulen

www.TheTechnicalTraders.com

How to Stop Being Scared or Shaken Out Of Winning Trades

he markets really frightened a lot of people in the last month. We've received lots of emails and comments from people wondering what's happening in the markets and why the deeper downtrend didn't prompt new trade triggers. Well, the quick answer is "this downtrend did prompt new BAN trade triggers and this pullback is still quite mild compared to historical examples". Allow me to explain my thinking.

The recent FOMC meeting as well as the expiration of the future contracts usually prompts some broad market concerns. Many professional traders refuse to trade over the 7+ days near an FOMC meeting – the volatility levels are usually much higher and this can throw some trading strategies into chaos. Our BAN Trader Pro strategy handles volatility quite well most of the time. Recently, the **BAN Trader Pro strategy** initiated new trade triggers of subscribers and myself. Our members are engaged in the best-performing assets for the potential upside price rally that may take place over the next couple of months. Our strategies target opportunities based on proven quantitative technology – not emotions and use proven position management to maximize gains while reducing draw downs.

Transportation Index Daily Chart Is Bullish

This leading index shows early strength in the market with an upside target of $14,668. That is a 3.5%-4.5% upside move ahead of us.

Recently, we've seen some substantial support in the Transportation Index that aligns with our BAN Trader Pro strategy. The rally in the Transportation Index, which usually leads the US economy by at least 2 to 4 months, suggests the markets are actively seeking out a support level/momentum base for another rally phase.

Using a Fibonacci Extension tool, we can clearly see the TRAN has another 3.5% to 4.5% to rally before reaching the 100% measured move target near $14,668. This level represents a full 100% rally phase equaling the initial rally from levels near $12,000 which started back in February 2021.

Dow Jones Industrial Index Daily Chart is Bullish

The Dow Jones Industrial Average has already reached the 100% Fibonacci Measured move – and broken above that level. If the markets rally from this recent pullback, we believe a 4% to 5%+ rally in the Dow index is very possible. This type of bullish price trend suggests a target level near $34,000.

One thing, many traders fail to consider is these 4% to 5% rallies in the Transportation Index and/or the Dow Jones Industrial Average will likely prompt an 8% to 20%+ rally in some of the best-performing assets/sectors. For example, after the bottom in early February, during a time when the index rallied less than 1%, the best-performing assets we tracked rallied more than 7% to 25%. The strength of these top-performing sectors/symbols can be very powerful – even while the US major indexes are drifting sideways.

If the Transportation and Dow Index rally 4% or more over the next few weeks, then some of the best performing sectors will strong gains in our favor. It depends on how strong these top-performing sectors react to the underlying momentum associated with each symbol though.

How to Avoid Emotional Trading Decisions

Trading based on emotions can lead to early, and sometimes foolish, entry and exits of positions. The market has a way of faking/shaking price which often prompt traders to react to the 2% to 4% swings in the markets as if they are catastrophic. Some of the best advice we can offer active traders other than becoming part of our trading group and pre-market analysis and trade alerts are...

_ Trust your system/strategy and follow it from entry to exit trigger.
_ Define your risks and run the strategy efficiently
_ Develop ways to identify and resolve strategy failure early and often
_ Trading involves risks – learn to execute the strategy within your risk parameters (position sizing)
_ Don't let emotions control you. Trade rules should protect you during high & low volatility conditions.

If you don't have a strategy and can't see yourself sticking to these simple rules, then maybe it is time to find a better strategy or to attempt to develop some of these tactics into your existing strategy. You can follow me to success with my ETF Swing Trading Strategy, or our Options

Trading Strategy at any time if you want all the work done for you.

Be sure to sign up for our free market trend analysis and signals now

so you don't miss our next special report!

Far too many people get lucky with a strategy then leverage their trading because they feel they will never fail. Failure of any strategy, often represented as the largest drawdown amount, should be multiplied by at least 3x when comparing risks. Just because your strategy showed one period of drawdown representing a -$5,500 loss does not mean that type of price activity is an isolated event. That type of drawdown could happen repeatedly, over a very short period of time, representing a -$16,500 loss.

The strongest strategy components are those that help to contain losses, manage risks and allow for the protection of capital. Remember, "living to trade another day" is far more important than huge gains off of one or two trades followed by a string he big losers that blow up your account.

In closing, get ready for a recovery in stock prices. With the indexes poised to move higher by another 3.5% - 5% before reaching the next 100% measured move suggests some sectors will post spectacular gains. Don't let emotions dictate your decisions – run your strategy (or find a better strategy to trade with). The best performing sectors/symbols usually continue to outperform the US major indexes when trending higher.

Don't miss the opportunities in the broad market sectors over the next 6+ months. 2021 and beyond are going to be incredible years for traders and investors. Staying ahead of these sector trends is going to be key to developing continued success. As some sectors fail, others will begin to trend higher. Learn how BAN Trader Pro can help you spot the best trade setups and deliver alerts to your phone and inbox.

We've built this technology to help us identify the strongest and best trade setups in any market sector. Every day, we deliver these setups to our subscribers along with the BAN Trader Pro system trades. You owe it to yourself to see how simple it is to trade 30% to 40% of the time to generate incredible results.

Using Gann's Rules with the Dogs of the Dow

In the study of Gann one can often become overwhelmed with the possibility of instruments in which to trade or invest. Sometimes there are reasons to trade certain instruments such as corn or soybeans as that is a crop that one grows. But how would a simple investor or trader select and then use Gann's techniques in today's world. One suggestion is to use a simple technique of selecting stocks that are then evaluated with Gann techniques.

One such technique is the Dogs of the Dow which has been popular since I began trading. I have modified the technique a bit but the essence is the same as one takes the lowest cost stocks in the Dow Jones Industrial Index and invest an equal amount of your capital into each one. This idea forms the basis for the choices of which to consider investing into for a period of time.

One adjustment is to consider the lowest 1/3 or 10 of the lowest cost stocks in the DOW and then look to a simple value of the P/E values. I use the current P/E and the forward P/E (future outlook). I ask a simple question is the current P/E higher than the future P/E and by how much. The table below shows the answer to that question for the 8 lowest priced stocks in the DJIA.

#	Ticker	Market Cap	P/E	Fwd P/E	% P/E chg	Div
1	CSCO	198.26B	19.35	13.59	29.77%	3.20%
2	WBA	41.07B		9.02		3.96%
3	KO	223.52B	28.44	21.86	23.14%	3.31%
4	VZ	236.76B	13.03	10.8	17.11%	4.48%
5	INTC	245.24B	12.29	12.52	-1.87%	2.29%
6	DOW	48.41B	38.79	17.37	55.22%	4.45%
7	MRK	190.12B	20.29	10.23	61.09%	3.56%
8	CVX	214.76B		19.71		4.73%

The table for the Dogs of the Dow shows 4 groups of stocks:

1. Future P/E is less than current P/E: INTC
2. No calculation of % P/E: WBA, CVX
3. Future P/E change is 0- 50%: CSCO, KO, VZ
4. Future P/E change is 50%- 65%: DOW, MRK

Having identified the "Dogs of the Dow" that would be traded by that simple technique we then take it one step further and evaluate the charts for each market for and understanding of the state of each market and the possible outcomes in the coming months or year.

Current P/E of INTC is not higher than the future suggesting stalled earnings. The monthly price

chart shows a range and price is currently at the top of the range. As the goal is to capture an upwards move during the next 12 months the outlook is not rosy. The range (due to stalled earnings) has been factored into the forward P/E and confirms that

the price is not expected to break out of the current range. So as a "blind" Dog of the DOW investment INTC could end up giving a loss or a dividend payment of 2.29% at best.

No calculation of Forward P/E: WBA, CVX as the earnings per share were negative for the 2020 year and company is experiencing losses.

Evaluation of **WBA**'s historic P/E shows that 2020 was a single event and attributed to the impact of COVID-19 in the UK. This gives a good opportunity for growth in 2021. The chart shows the price at a 10-year low. Additional study shows that a yearly high can be expected in May or June giving a warning about currently investing long for more than a short time period of no more than 3 months.

On the monthly chart **CVX** is at 110 and approaching resistance at 113 and a multiyear topping area with a strong resistance at 120. As a short-term trade, a gain of 20% is possible and a date of May to August would be expected for the high but the low entry point was missed. Entry in October 2020 would have given the best gain.

These 3 charts are suggesting that an entry into the market at this point in these instrument is likely ill advised as the markets tend to top out in early summer for the summer downtrend. A quick look at the other markets gives a similar outlook due to the time of the year and the state of the charts.

Future P/E change is 0- 50%: CSCO, KO, VZ all show range bound stocks that have persisted for more than a year and any move inside the ranges towards the upside have been made.

Future P/E change is 50%- 65%: DOW, MRK are the only two that would give a possible trade depending upon one's level of risk acceptance.

DOW has been trending upwards for the past year as it moves out of its all-time low since beginning trading as a spinoff of the DOW/Dupont company as one of 3 independent companies. This is the reason for such a short span of market data. It has moved up above the prior highs and Gann's rules would say trade a market that is making new highs. BUT it is trading at the top of a price channel which it has hit 3 times without passing through suggesting a break downwards is on the horizon. Caution is raised with this state.

And finally, **MRK** (Merck) appears to be the best trade for those looking to trade the Dogs of the DOW at this time of year. Stock price is currently at the bottom of a downtrend that began in January 2021 and has just broken above the low bar of the downtrend. Another up weekly bar and Gann's 3 bar low rule will be in play and an entry long would be suggested. There is plenty of room above price to get a 15% return in the trade.

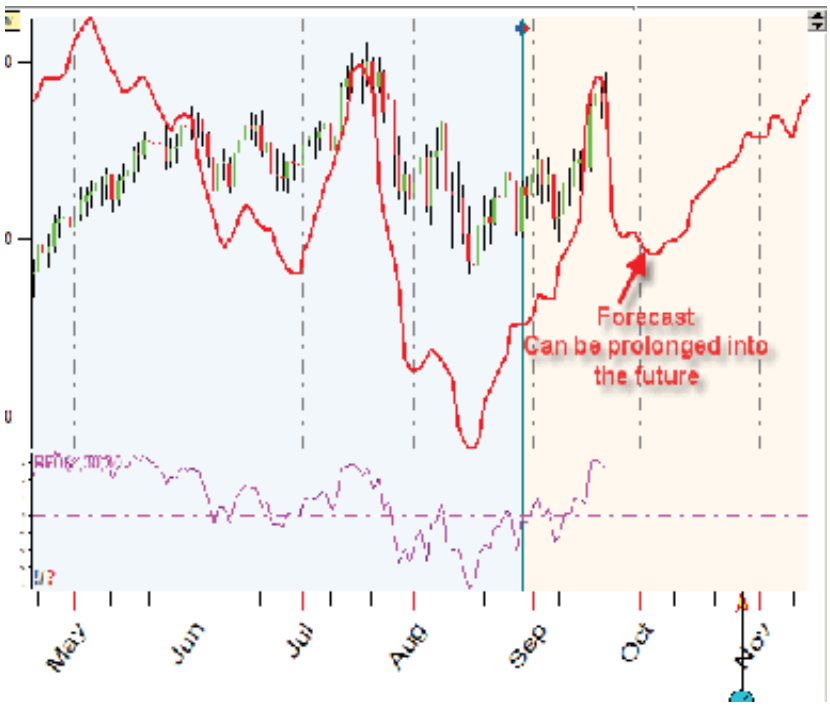

The above shows two points to consider. First is that the Dogs of the Dow technique is best used at the end of the year or slightly before (October) and not in March as most of the upwards trending occurred well before the current month.

Second, that by observing the actual price charts of the Dogs one can get a confirmation of the first point and know that it is likely best to not try and bend the rules of the simple technique. In Gann's rules for trading and chart reading are the rules to prevent entries into markets that would likely produce losses or at best delayed profits at this point in the year.

For more information about my research, work, and my 4-volume series on Gann's **Law of Vibratio**n, please see my author page at the **Institute of Cosmological Economics**, here: https://www.cosmoeconomics.com/EZ/ice/ice/lorrie-bennett.php

Timing Solution

Forecasts the Markets Instantly!

Timing Solution generates projection lines based on fixed cycles, astronomical cycles and other types of models.

The software considers models that deal with natural cycles, cycles that are based on celestial bodies' movement.

The program analyzes tens of thousands of different planetary lines.

The Universal Language of Events module allows you to create more advanced models analyzing everything that occurs in time and researching the effects of these phenomena on the stock market.

❄ You can ask the program to reveal the most powerful cycles for your financial instrument.

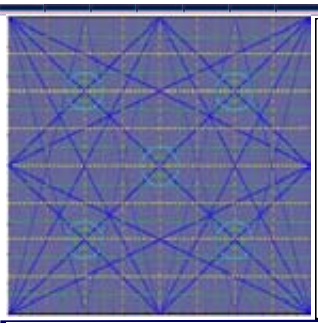

❄ Special algorithm that reveals the freshest/newly appeared/strongest cycles.

❄ The program analyses all turning points, provides their statistical analysis and displays the most probable support/resistance levels.

❄ Charting Tools, Fibonacci levels, Pitchforks, Gann Angles and many other traditional charting tools are available.

THE TEXTBOOK OF GANN ANALYSIS...

THE PATH OF LEAST RESISTANCE

THE UNDERLYING WISDOM & PHILOSOPHY OF W. D. GANN ELEGANTLY ENCODED IN THE MASTER CHARTS

BY DANIEL T. FERRERA

MOST DETAILED COURSE ON GANN'S MATHEMATICAL & GEOMETRICAL TOOLS!

"WE USE THE SQUARE OF ODD AND EVEN NUMBERS TO GET NOT ONLY THE PROOF OF MARKET MOVEMENTS, BUT THE CAUSE." - - - W.D. GANN

- **How to square the natural whole numbers (odd and even), along with their midpoints.**
- **How to define prices scales by "The Basis of Money"**
- **How to set the proper scale, and use the 1x1 angle to square or balance price with time.**
- **How the natural squares (even & odd) sub-cycle would not be possible without understanding the Spiral chart (Square of 9).... expressing the square root as an "inner square" time period.**
- **How to assimilate all of these elements together as a sequential methodology once the "basis of Gann's forecasting method" has been worked out.**
- **How Gann's price squaring techniques and master charts are NOT completely separate and independent methods, but are tied together thru geometric angles.**
- **How the inner square root sub cycle & natural squares of numbers reveals unique market turns.**

INTENT OF THIS GANN COURSE

The intent of Ferrera's new course is to provide the most comprehensive elaboration of W.D. Gann's most powerful technical trading tools. It presents all of Gann's foundational mathematical and geometrical techniques expressed in his master calculators, angles, trend channels, squaring processes, pattern formations, spiral charts and much more, leading to the clear identification of profitable Trade Setups, important trend indications, and critical price/time culminations.

The material further elaborates a number of Gann's most advanced geometrical tools and applications, such as the natural squares (even & odd) sub-cycle and the square root as an "inner square" time period, . It provides both practical and actionable trading signals and a valuable structural perspective to any market on any time frame.

With 300 pages of detailed text, over 150 charts and diagrams, and 190 pages of the rarest Gann's supplementary material, we consider this 500 page treatise to be THE TEXTBOOK on Gann's geometrical techniques that no serious Gann analyst can be without!

FERRERA'S NEW COURSE—THE ART OF THE TRADE

W. D. GANN'S SYSTEM OF CHART READING & PATTERN TRADING

Dan Ferrera's new trading course, ***The Art of the Trade***, provides thorough instruction in W.D. Gann's key trading methodology, **Pattern Trading**. It teaches **"Chart Reading"** the way Gann himself did it, demonstrating how to trade the fundamental market patterns identified by Gann. This strategic approach to trading provides advantages that allow the trader to react to the markets in real-time, without indicator lag. Pattern Trading eliminates lagging mechanical indicators, which are always based on what the market did in the past and not the present. This style of "Form-Reading," as Gann called it, allows one to make decisions in real time, as the opportunities develop on the chart.

The course provides a clear set of rules for reading these market patterns to determine entry, exit, risk management, and trade management as determined by the recognition of a set of fundamental market patterns identified by Gann. This approach differs from Gann's mechanical swing indicators and from his long-pull position trading, providing a different perspective and alternative trading style, that most often used by Gann himself. The technique is equally effective on any time frame, so is as valuable for day-traders as it is for daily traders. It also generates a larger number of trades than his other trading methods.

How W. D. Gann Uses Words and Gematria to Conceal Cycles

By Robert Rundle

Following up on the previous Traders World #70 article "How to construct A Tunnel Thru The Air", I want to explain how W.D. Gann's application of Words and Gematria to conceal his cycles.

Most Gann researchers are aware of the Gematria process of converting an alphabetical letter and words to a numerical value via Gematria, but none have sufficiently proved it within Gann's writings. Gann thru his non-deplume Luo Clement book 'The Ancient Science of Number' is a great example of the '9' based 'Pythagorean Gematria' system, but this is only a teaser to the Bible/Masonic Gematria Cipher that he widely used.

The Gematria Values of Words give the number series for calculating his Cipher to astrologically determine the anchor points of his cycles, the cycle's growth dynamics, and its harmonic ratio proportions. Qualities that we would label as 'The Law of Vibration' and 'Natural Law'. It sounds complicated, but in reality, it is very simple once you know his many processes.

Be aware, this will challenge your cognitive dissonance regarding pre-learnt Gann theories. I make no apologies. Gann and his peers had a secret, and you were not invited to join their Club. Nearly everything he wrote contained hidden ciphered cycles with good vibration, even as early as his letter home to his parents Christmas 1907.

So his Parents were in the Club? Disappointing to most readers who believe his every word at face value. Sorry, but you were Fooled, you were not in the Club. Many would be insulted to know just how much they were fooled, and how great the truth was, just under their noses. This 'Lost Art' was a common practice amongst the academics of this era and days past.

Without giving the cipher away, simplifying the book series method, I will give some resulting examples that you can test for yourselves.

Gann, in his own words tells you *'The **"Tunnel Thru the Air"** is mysterious and contains a valuable secret, clothed in a veiled language'*.
Sure, you scream, I've seen this a thousand times before. But did you notice the font structure of the sentence? The small 't' of 'the', 'The Tunnel Thru The Air' now becomes 'Tunnel Thru Air' for this example given on the first page of the Foreword and never repeated again thru the book.

Simply evaluate the Words using a 9-based Pythagorean Gematria, equate a summation series for the 3 Word cycle, the percentage within the cycle, their midpoint values, and overlay onto a stock indices chart to evaluate its properties.

PYTHAGOREAN GEMATRIA VALUES								
1	2	3	4	5	6	7	8	9
A	B	C	D	E	F	G	H	I
J	K	L	M	N	O	P	Q	R
S	T	U	V	W	X	Y	Z	

TUNNEL 235553 = 23, THRU 2893 = 22, AIR 199 = 19.

WORD	9 GEMATRIA	Σ %	CYCLE%	MidPoints
TUNNEL	23	23/64	35.9	17.9
THRU	22	45/64	70.3	53.1
AIR	19	64/64	100	85.1
Σ=	64			

Assume the known obvious cycle anchor dates from the Forward's 9th May to Robert Gordon's Birth date and starting the book with 10th June, add +365 days (effectively Squaring the Circle) for 397 days. Gurus with poor charting software can use MS Excel to give TUNNEL 35.9% on 9th May + 142.5 days on 28th Sept, THRU 70.3% for 279.1 days on 12Feb, and AIR 100% of the cycle 397 days on 10th June. Mid Points or 2nd Harmonic dates are 19th July, 5th Dec and 12th April. Cycles repeat forward.

'Timing Solutions' software plots these values to the fraction of a % perfectly – www.timingsolution.com. I will post all these models there.

The same process with Gann's Bible Gematria Cipher –

WORD	GANN CIPHER	Σ %	CYCLE%	MidPoints
TUNNEL	22	22/57	38.6	19.3
THRU	24	46/57	80.7	59.65
AIR	11	57/57	100	90.35
Σ=	57			

TUNNEL 38.6% 153days on 9th Oct, THRU 80.7% on 25th March, and AIR 100% on 10th June. 2nd harmonic Midpoints on 24th July, 31st Dec, and 2nd May.

Also anchored at 9th May to points where Price Crosses the Tunnel Thru The Air Lines (from my previous Traders World article) +3 Days.

If we 'Look Back' to the Front Cover we see another variation to the font "THE TUNNEL THRU the AIR", omitting the second 'the' using the 9-based Gematria we get - THE 18.98%, TUNNEL 48.1%, THRU 75.94%, and AIR 100%. Midpoints 9.493%, 33.54%, 62.02%, and 87.97%. 4th Harmonic points at 4.75%, 14.24%, 26.26%, 40.82%, 55.06%, 68.98%, 81.96%, and 93.98%.

Using Gann's (Secret) Gematria Cipher we get - THE 24%, TUNNEL 53.33%, THRU 85.33% and AIR 100%. Midpoints at 12%, 38.7%, 69.3%, and 92.7%. And 4th Harmonic points at 6%, 18%, 31.33%, 46%, 61.33%, 77.33%, 89%, 96.33%.

Using the full phrase worded "THE TUNNEL THRU THE AIR" using the 9-based Gematria we get – THE 15.95%, TUNNEL 40.42%, THRU 63.82%, THE 79.78%, and AIR 100%. With Midpoints at 7.98%, 28.19%, 52.12%, 71.8%, 89.9%. And 4th Harmonic points at 4%, 11.96%, 22.07%, 34.30%, 46.27%, 57.97%, 67.8%, 75.79%, 84.84%, and 94.94%.

Using Gann's (Secret) Gematria Cipher we get – THE 19.35%, TUNNEL 43%, THRU 68.8%, THE 88.2% and AIR 100%. With Midpoints at 9.7%, 31.2%, 55.9%, 78.5%, and 94.1%. And 4th Harmonic points at 4.8%, 14.5%, 25.26%, 37%, 49.46%, 62.4%, 73.65%, 83.3% and 91.1%.

While I'm here on the Tunnel Forward, Gann's very first words were "Happy is the man that findeth wisdom, and the man that getteth understanding" from Proverbs 3:13 (and Rev 13.18). Working under the auspices of Gann we soon come to understand that he is subtly giving us an extensive lesson in esoteric knowledge, affiliating us into his secret club, without us even being aware. Remember "MAN" is 'Made in the Image of God', therefore Man looks exactly like God, or Man equals God. So consider, I am a Man, I am

God, you are a Man, making you a God, we are all Gods, or should that be 'IAM GOD'? Ehyeh Asher Ehyeh, Iam that Iam. "Iam" or "I" equals 5, the 5th Zodiac is Leo, when the Sun is at 0*Leo on 23rd July, you know the Bible's "Young Lion", "King of the Jungle", the "EYE (I) of Providence", the B-Grade celebrities running around with One Black (Right) EYE or making "OK" hand gestures over their EYE, etc. OK, you are now in their Club, you can now understand that they are self-apotheosising themselves to be God. "I", say it loud and proud, for good personal vibration.

23rd July (Hidden at ±365/2 on 22nd Jan) is a critically important Zodiac Point/Date as it is one of the places that our Non-Monotheistic Gods hang out. So many cycles are God-based, either anchored from, reflected from, or to be relocated back to these points.

Hence Gann's constant Biblical themes, quotes, The Magic Word. Gann's Tunnel character Edna+Kennelworth equals Hidden 'I' 22nd Jan, so now the reader can see why she marries, and why she is such an important character Thru out the book. As Edna+Quinton she anchors to 7th March and vibrates 454 days to 4th June /h16, marries Walter for a name change and Edna+Kennelworth now anchors 22nd Jan (our Hidden "I") vibrating 482 days to 19th May.

Did she have good vibration with Walter? Yes, but add 1 day (Esoteric Cycles 101 - where 2 Lovers become 1 - for 28th Nov and 7th May). Walter+Kennelworth 27th Nov +525 days to 6th May /h16.

Was Robert compatible to Marie? Robert+Gordon 9th Apr (The+Magic+Word) add 410 days to 24th May /h16 but move the cycle -3 days (it is a Hero Theme thing) to 6th April + 410 (or 775d) to 21st May /h16. A 12th Jan also likes a 410/h16 day cycle. Marie+Stanton 19th Dec add 526 days to 29th May/h16. Marie+Stanton 19th Dec to Robert+Gordon 9th April for 475 days, you can see why Gann hid her here in The+Tunnel+Thru+The+Air 16th June, 16th Dec and 7th April. And Robert+Gordon 9th April (-3) add 622days to Marie+Stanton 19th Dec is compatible – but we all knew that. Robert+Gordon 9th April (-3) to The+Tunnel+Thru+The+Air 16th Dec (619days) and 7th April (732days).

Gann often corrected and refined the mathematics of esoteric parallel characters, the Robert/ Walter relationship is a good example – ROBERT 16th Aug (-3 for the Hero) to WALTER as 17th June, but use 18th June because 'Walter was one year older' (cycle 309 or 674 days). Gann was super accurate, no room for mistakes.

His mathematics and perfect understanding of Cycle Ratios, what Date vibrates to what numbers, their following vibrating growth factors was way superior than we had previously known.

But be aware he writes stories in code that contain some truths at their face value, but these stories are just a means to carry his Words, Dates and Numbers. Moses didn't really turn a Stick into a Snake (Cycle).

Back to the first line of Tunnel 'Happy is the Man', because he 'Walks with God' he is Anchored on 25th April and travels for 440 days to 9th July and divide by 16 equal parts (16th Harmonic). But in typical Gann style, if you happily find this wisdom and understanding you may see that Jesus Christ (the Jewelled Crown) is still alive at this point, and a secondary lesson is learned when Jesus (that Other Hero) 'Dies for our Sins'. Then additionally you can add 440+n*33 i.e., 440, 473, 506....

Frank C Higgins in his 1919 Book 'Ancient Freemasonry' claims Pythagoras received this symbol from the Egyptians. A Freemason's favourite project with the Forty-Seventh Problem of Euclid and the 'Eye of Horus' within the Pythagorean Triangle.
For this to be true "SQRT((OSIRIS^2)+(ISIS^2)) = HORUS" we need the correct values for the 3 names. Traditional Gematria fails to prove this statement. Easy really, Higgins gives all the clues. Any freemasons up for the challenge?

Here is the resulting Ratio Series (Calculations hidden)
OSIRIS 39.6%, ISIS 56.6%, and HORUS 100%.
Midpoints at 19.8%, 48.1%, and 78.3%, with the 4th Harmonic values 9.9%, 29.7%, 43.8%, 52.4%, 67.5%, and 89.2%.
Anchor the cycle at HORUS 19th Sept and thru to
OSIRIS+ISIS 31st Jan for a 499 day cycle,
or EYE of HORUS on 17th Feb for a 516 day cycle
or to the point where Price Crosses Thru The Tunnel Thru the Air Signs + 9 days.

Mr. Gann in Miami Florida 1938
Picture used with permission from our friends at wdgann.com

There are not many pictures of Mr Gann outside of his portraits. I would suspect he would have jumped at the chance for this photograph! Or maybe set it up. Bit of a Happy smirk going on there? Knowing one day someone like us will spot his humour, his numerical message with its good vibration.

MIAMI+FLA = 16th Nov or 'TREE' or Hidden YHVH (God). The Tree being dead (hidden) points us back to God. And 1938 = 1+9+3+8 = 21

WDGANN = 10th Aug +365 to MIAMI+FLA 16th Nov = 463 days/h16. And adding + recurring n*21 days, dividing the cycle period by equal parts /32h as you go. Nice one Mr. Gann. But wait, there's more.

There are 'Trees' on either side of him.....nearly connecting him to God. Anchor the cycle starting point to 18th May add 449 days to 10th Aug, then repeating n*28 days. I.e. 477days 7th Sept, 505days to 5th Oct, 533days to 2nd Nov.....

He would have been 60 years old here, and walking with a cane.....should we pick up the cycle values and Anchor starting from 17th July?

Hostage Harry?
Most would not care less about the current silly Media Drama around the Oprah Winfrey, Harry and Meghan interview on 8th March 2021. Who cares I hear you say? What does this have to do with trading markets? Unbiasedly I care, because every time Harry says something, does something Iam watching, looking at his Word Play (Ciphers) and symbology hinting at Sensitive Dates and Cycle Timing.

Is he well trained in the esoteric arts becoming his Royal status and education, or is this just a remarkable series of coincidences that resonate to the mass human behaviour that is the financial markets? Despite his expertise's, he does not conceal these esoteric secrets very well. So keep an 'I' on him because it is easy for U to C.

Dear Harry as the face of his "INVICTUS GAMES" Self-Apotheosis himself as "IAM" (God) on 24th July.

What if we plot over a financial market chart a cycle anchored at "IAM" on 24th July, add 592 days to his Perfectly Planned Release Date of 8th March used for his Documentary's Vibration? Divide this by 32 equal portions? Was this purposeful to improve his own personal vibration? A Hostage, or deliberate timing and well in control?

Or IAM 24th July to our Hero 'HARRY', now the Victim = 6th Sept for 774 days/H32.

Planned and Released on the HIDDEN HARRY date, exactly as I would have expected. Visualize our Hero Harry 'Walking Thru the Chicken Coup', and Meghan's 3 Disc necklace seated to his left.

Why not thro Harry further under the Esoteric Cycle Bus and reveal more of his esoteric knowledge of Word:Number:Date:Cycle:Vibration games?

Harry's "INVICTUS GAMES" has him as "IAM" pretending to be "God" for the good vibration, and further Self-Apotheosising himself "Jesus Christ". Sweet Jesus, would that be 6th July + 416 days to 26th August /32 divisions? What if we further divide this 416 days by the Gematria Value Series of the lines of the Poetry used in their advertising and promotions?

OMG, cool trick, but hardly anything new under the Sun, Iam sure he just copied it from previous masters.
For more information on my 3 Volumes Series, Magic Words thru the Zodiac, of which Volume 3 is fresh off the press, see my author page at the Institute of Cosmological Economics here:

GANN SCIENCE

The Periodic Table & The Law of Vibration

THE SOLUTION TO GANN'S LAW OF VIBRATION
AS PRESENTED IN THE TICKER INTERVIEW

By Eric Penicka

ATOMIC ELEMENTS DEFINE MATHEMATICAL STRUCTURE OF MARKETS

HOW EXACTLY DOES THE PERIODIC TABLE OF ELEMENTS DEFINE MARKETS?

This course provides the solution to the Law of Vibration, as Gann originally presented it in his interview with Richard Wyckoff in ***The Ticker and Investment Digest***, in 1909. The author takes Gann's exact words and correlates them with the cutting edge science of Gann's day to demonstrate what Gann meant when he said, **"stocks are like atoms"**. He develops a system which identifies the key "mathematical points of force" that govern the structure behind the market.

The author builds a solid foundation in the Natural Sciences of Gann's day, showing how the emerging science of the **Periodic Table of Atomic Elements provides a system of order based upon the vibrational values of the elements** themselves. When the elemental structure is determined for an individual market, a **Master Number Set** will be defined for that market which determines its movement in price and time forever into the future. **A POWERFUL & HIGHLY PRACTICAL SET OF TRADING TOOLS! 480 Pages w/Forum.**

ERIC PENICKA - MAIN AUTHOR PAGE - GANN SCIENCE - HORSE RACING

A DECODER FOR GANN'S TUNNEL THRU THE AIR

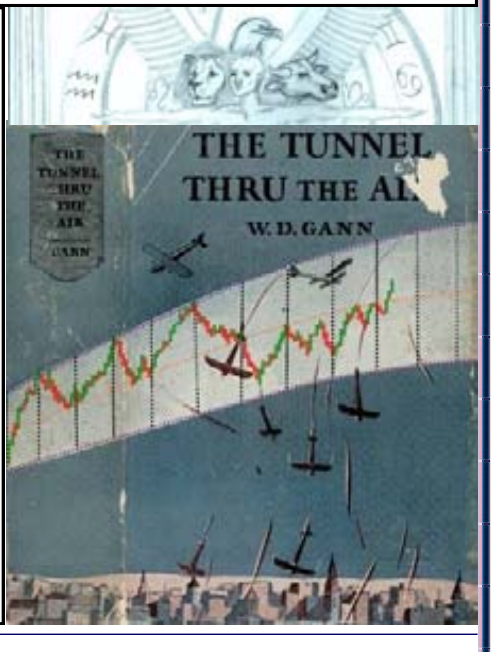

MAGIC WORDS THRU THE ZODIAC

Vol 1 - A Guide to the Work - Vol 2 - The Advanced Findings

Volume 1 introduces the Keys to cracking the complex symbolic code that Gann used to conceal his greatest secrets within Tunnel. It unveils a Masonic Gematria cypher which serves to decrypt references and clues concealed in names, dates and other key words thru the text. These letter/numerical conversions are used to determine potential anchor points for the engineering of important underlying market cycles.

Volume 2 continues the research into more advanced topics and more deeply hidden and important cycles. The insights in these two volumes represents efforts from 20 years of tireless research!

Profiting from Market Symmetry via Pendulum Motion

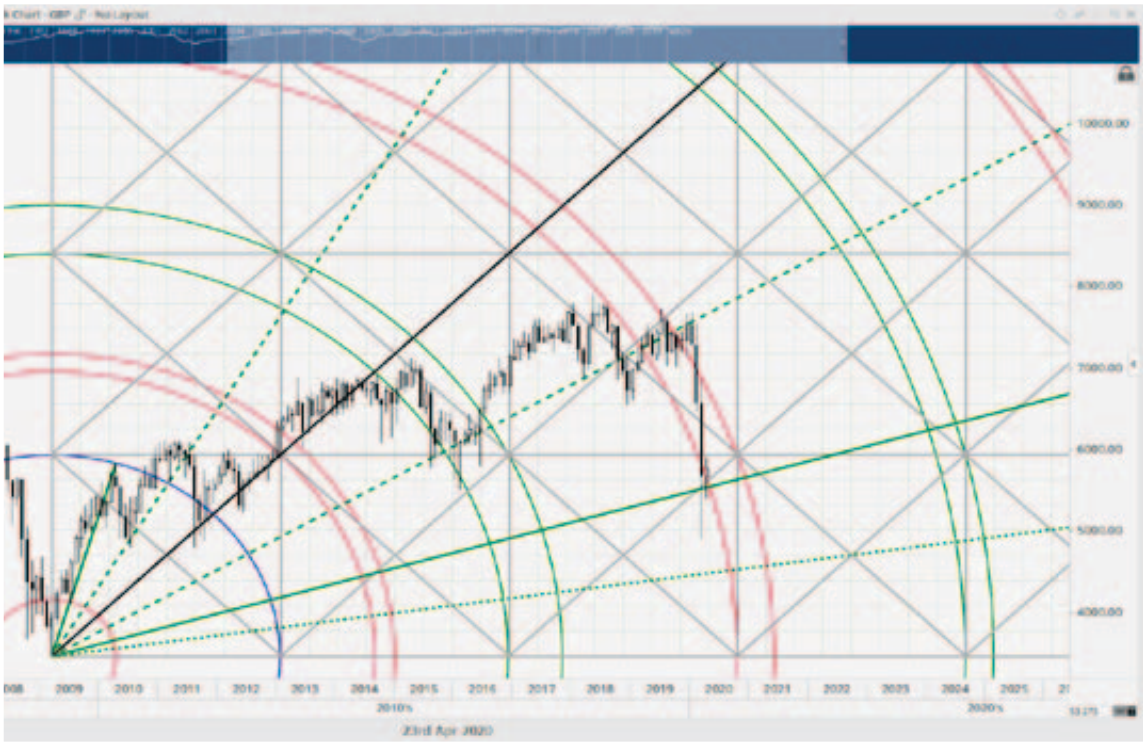

By Alexander Straker

As legendary trader psychologist Mark Douglas would say, "If you can't see the symmetry, don't take the trade".

In this article we will be continuing the study of ***pendulum motion*** as it applies to technical analysis, and in particular the concept of ***limits of rotation***. All traders desire convenient ways to seek out low risk set-ups and learning to identify limits of motion via symmetry is one of the more powerful and reliable ways to help locate good reward for risk set-ups.

The fractal development of price action on a chart occurs in alternating sequences of impulse or ***thrust*** (fairly straight-line price move) followed by retracement or ***rotation*** (price correction that follows an arc), then this sequence repeats again, thrust & rotation, etc.

The geometric thrust and rotation shape of price movement is neatly revealed by the harmonic pendulum motion chart template. The example below is a FTSE Index Monthly chart. Note the impulse swings are quite straight from point to point. The retracement swings tend to follow the geometric arcs.

This is why we commonly see the final wave in a retracement accelerate (violent C Wave) as it is the geometric arc that is containing price action and dictating the rate of acceleration until time is inevitably up and price MUST move through the arc, at which point it begins a new thrust phase.

This sequence of thrust and rotation is in fact an illusion caused by our 2-dimensional viewpoint of the spiralling nature of price movement, a 3-dimensioinal occurrence.

This movement would appear similar to the rifling action of a gun barrel if we could see it in 3D (if you imagine a 'Z' axis moving into the page, it can in fact be visualized in 3D by the human brain). The spiral grooves of a gun barrel that cause the rifling action are designed to induce a bullet to spin as it travels along the barrel, greatly improving the velocity and range of the shot.

Because of our 2-dimensional view of the action, the price movement appears 'straighter' at times and more 'curved' at other times depending on the position of price in relation to our 2-dimensional vantage point or perspective.

This creates geometrically measurable sequences of thrust vectors whose rate of rise over run in magnitude and direction represent *velocity. In order to arrive at the answer to scaling the chart correctly, our question should be…* what exactly does the velocity of price represent?

In other words, *price is what we see on the chart, but is there a parallel phenomenon in nature that we can relate price to, and that travels at a specific velocity in relation to time?*

This question is answered in Book 2 of the **Universal Golden Keys Series:** ***Golden Speed: Harmony of the Square***. The answer leads us to a major breakthrough in understanding scaling and the true relationship of price versus time.

Once a universal *'connection'* between price and time has been established, each impulse of 'thrust' price movement can be scaled correctly to reveal accurate geometric symmetry of the price action spiral as it forms. This price-time 'connection' or market **key** unlocks the geometric perfection inherent in the 2-dimensional representation of the spiralling price action, by bringing the price action on our chart into natural alignment with a particular form of wave motion (explained further in my books).

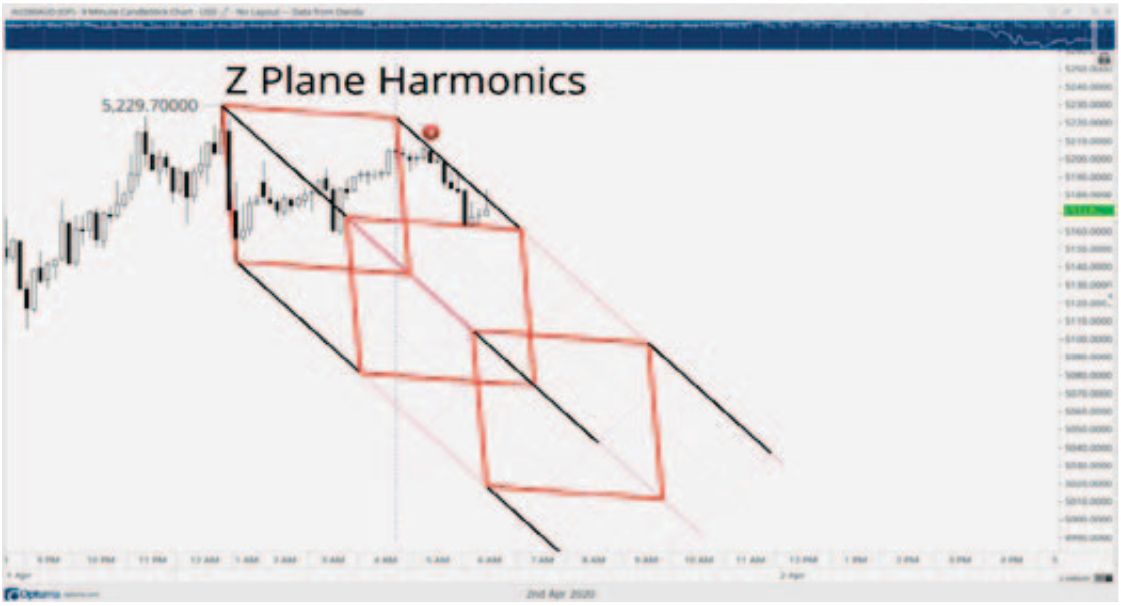

This price-time relationship is derived from a number of simple facts of science, strongly suggesting a direct correlation between a particular phenomenon of nature and price action. In my view, the phenomenon of nature we are dealing with is largely the source of causation of market movement.

As this causation is a type of wave form, so is the resulting price action, though multiple wave forms can overlap and usually these are harmonically related waves by frequency. Again, the harmonic relationships tend to be whole number ratios. The key ratios are given to us by the ancient language of music and are expressed in simple whole numbers such as 1:2, 2:3, 3:4, etc.

The symmetry of wave form is ever present in the market. It is essentially the accurate measurement from peak to node to trough or vice versa that allows us as traders to profit from this symmetry. However, if we are seeing the 3-dimensional spiral from a 'skewed' vantage point (in other words we are applying a random and poor price-time scale for geometric use), then we are unable to locate this symmetry as it remains hidden by the

poor vantage point. Scaling solves this issue by giving us a symmetrical *vantage point from which to view the action.*

The following example is one way of beginning to visualize price as travelling in a 3-D plane.

As Gann told us, there is more than one solution to finding a useful scale. There is, in my view, one universal starting point, and that is the characteristics and dimensions of a circle.

In Gann's case, to plot the spiralling (3-dimensional circular or planetary motion) successfully on the chart, he had a particular way of using the scale to 'square' the chart. I contend this was the most practical solution of Gann's day due to the fact hand charting was done on squared graph paper and there were no computers to do ongoing complex numerical calculations. So, as a consequence, a universal ratio-based system was ideal for mapping it out.

Gann knew the market vibrated in related frequencies and the ratios between the frequencies of highs and lows in the market corresponded to the common ratios of perfect harmony in music. The most important of these frequency ratios are the Tonic, Mediant, and Dominant, also known as the first, third and fifth.

Gann angles apply simple whole number ratios of a square to the 2-dimensional view, and providing this has been scaled to our key, the angle ratios will define symmetrical limits of rotation occurring on either side of a 1x1 ratio or master angle.

Even on smaller time frames the limits of rotation are universally accurate the majority of the time (please see the DAX example below). Symmetry occurs where, for example, a vector ends on a 4x1 angle and the subsequent retracement squares out at the 1x4 angle (symmetrically opposite to the 4x1 angle) .

The repeated symmetrical limits of rotation are very clearly defined by the scaled angles. This is a consistent and worthwhile edge to be aware of in the market. There are other ways to plot 'custom' symmetrical angles using *degrees* of a circle, and these can have some advantages over ratio based ones.

A full explanation of these methods can be found in Book 1 of the **Universal Golden Keys** series: ***Pendulum Motion: The Harmony of the Circle***.

The harmonic structure of almost all Western music is based around the three frequencies *Tonic, Dominant* and *Mediant*, with the *Sub-Dominant* also being very prominent. A typical formula for harmonic structure pleasing to the ear is to begin with the Tonic or Chord I (Tonic meaning at rest, refreshed and healed), then progress harmonically through various chords until reaching a culmination at the Dominant or Chord V (Dominant meaning having strength & influence over the Tonic).

Chord V strongly leads back to the Tonic meaning the ear wants to hear the Tonic again at this point in the harmony. This is to resolve the final musical phrase with a pleasing sound arriving back at rest again.

Extremely common and pleasing to the ear is a Chord IV-V-I progression, and this neatly closes off the song harmonically for our ear, resolving at Chord I, the Tonic. The interesting thing about this is that it perfectly represents the "as above – so below" principle at work in music (or action – reaction – neutral, or IV-V-I, or Sub-dominant – Dominant - Tonic).

In terms of proportion, the *Sub-dominant* is of equal distance from the *Tonic* on the opposite side to the Dominant (As above – so below). Depending on how you position the notes, the Sub-dominant is 2 whole-steps and a half-step *above* the Tonic, and the Dominant is exactly the same *below*, OR; the Sub-dominant is 3 whole steps and a half step *below* the Tonic and the Dominant is exactly the same *above* the Tonic.

Symmetrical musical motion! To gain a sense of this musically is to arrive at an appreciation of the natural symmetry of the sound at work, and how it pleasingly 'closes off' the harmonic phrase bringing the music to a natural end point (limit of motion) both when it peaks at the Dominant (Chord V), and again when it rests at the Tonic (Chord I).

Each time the harmony changes, the music is essentially expressing a new harmonic ratio relevant to the key. Consider now the parallels between this musical sequence just described, and the basic Elliott Wave set.

Music

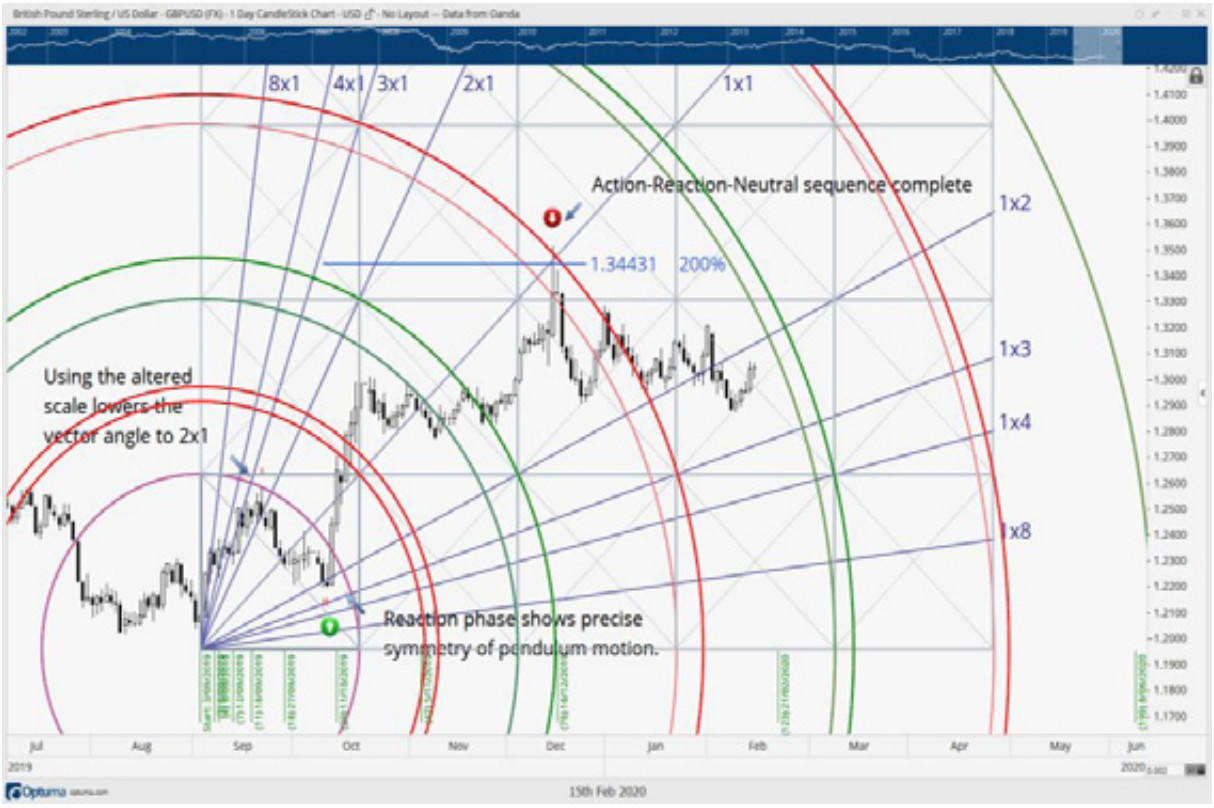

- Typical harmonic structure works its way from the Tonic to Dominant (Chord I to Chord V)
- Chord V (Dominant) has the most strength/influence and is a natural 'limit' of the harmony, wanting to resolve back to Chord I Tonic.
- A natural peak in the harmonic structure occurs at the Dominant (Chord V).
- A common ending harmonic sequence is: Chord IV (Sub-Dominant), Chord V (Dominant) then Chord I (Tonic).
- In ratio and actual mathematical proportion, Sob-dominant and Dominant are equidistant from the Tonic, representing *'as above – so below'* or *'action – reaction - neutral'*

Elliot Wave

- Impulse works its way from Wave I to Wave 5.
- Wave 5 is a natural limit of the impulse fractal sequences, and this could be thought of as the Dominant fractal.
- A natural peak in price action occurs in price action at Wave 5.
- A scaled chart will reveal in most cases following an impulse 5 Wave set *(Action)*, we observe a symmetrical retracement *(Reaction)*, then Price will most often return to the 1x1 master angle *(Neutral).*

The Action – Reaction – Neutral sequence is the same as a wave form expressing a Trough – Peak – Node sequence, and once again the distance of the peak and trough around the node must be symmetrical, a simple natural characteristic of wave form. This is also the reason Median Lines are effective geometric tools as the Median Line effectively captures the Node of the wave form being examined by the median line set.

Here are a few further examples of the limits of Pendulum Motion. Notice in this next GBPUSD example how price overshoots the 2x1, and then the symmetrical 1x2 angles by the same amount.

Finally, an example using angles created from circular degrees. This requires a different type of scale as taught in the books. As always, the point of the exercise is that we observe the natural symmetry of market's fractal development. Practice and application of genuine scaled geometric techniques is an ideal and convenient way to consistently locate the limits of motion of price action, and well worthy of our study!

Any technique that *improves our reward for risk ratios and therefore profitability* should be given the highest priority, and scaled angles demonstrating the limits of motion is most certainly one such technique.

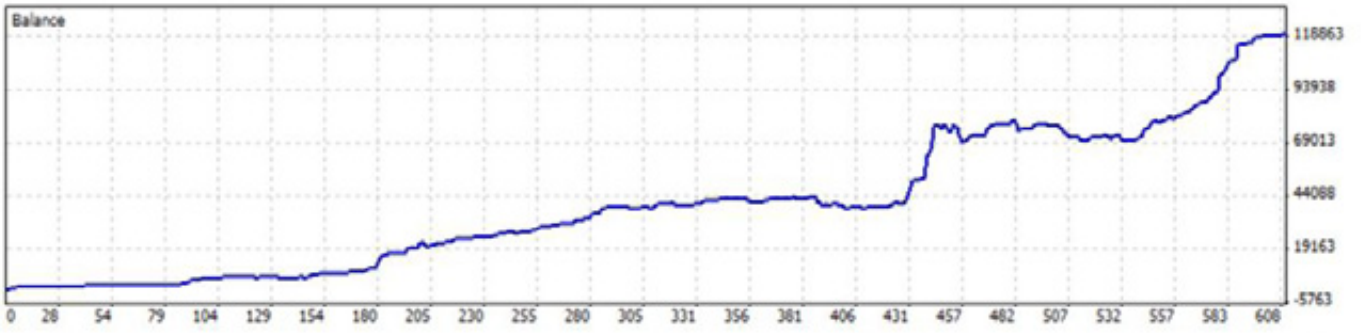

Finally, as an example of the level of effectiveness in trading that these Pendulum Motion techniques can produce, I will share the results of 1 week of trading accomplished recently while training my trading staff.

I acknowledge that I was in the zone and do not hit these kinds of numbers regularly, as I usually trade longer term stocks which pay dividends for my clients. This intraday trading, I do to test the potentials of these trading tools, and it took extra work and less sleep (due to living down-under) to accomplish. However, these results beat those of the great W. D. Gann in his famous 1909 ***Ticker Interview*** by over 10-times in ¼ of the trading period! **12,000% in 1 week!** Here is my trading account Summary for that period:

Summary:

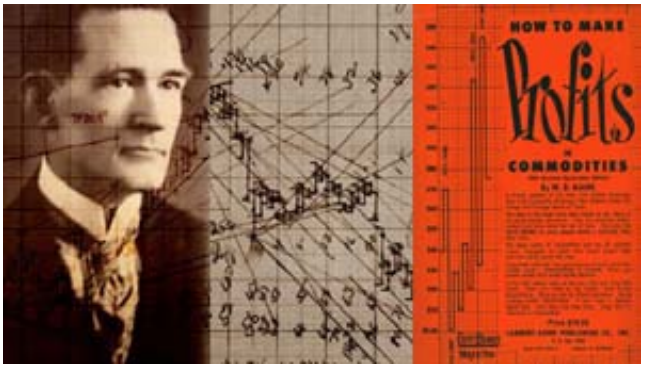

Deposit/Withdrawal:	1 011.81	Credit Facility:	0.00		
Closed Trade P/L:	118 873.00	Floating P/L:	518.20	Margin:	1 048.72
Balance:	120 116.51	Equity:	120 634.71	Free Margin:	119 585.99

Details:

Gross Profit:	183 370.13	Gross Loss:	64 497.13	Total Net Profit:	118 873.00
Profit Factor:	2.84	Expected Payoff:	196.81		
Absolute Drawdown:	0.18	Maximal Drawdown:	10 260.09 (12.94%)	Relative Drawdown:	26.55% (263.01)
Total Trades:	604	Short Positions (won %):	418 (77.99%)	Long Positions (won %):	186 (69.89%)
		Profit Trades (% of total):	456 (75.50%)	Loss trades (% of total):	148 (24.50%)
Largest		profit trade:	7 265.51	loss trade:	-3 883.44
Average		profit trade:	402.13	loss trade:	-435.79
Maximum		consecutive wins ($):	28 (32 749.69)	consecutive losses ($):	4 (-1 613.71)
Maximal		consecutive profit (count):	37 369.85 (17)	consecutive loss (count):	-7 531.56 (2)
Average		consecutive wins:	5	consecutive losses:	2

To learn how to trade like this and for more information on my **Universal Golden Keys Series**: ***Pendulum Motion: The Harmony of the Circle*** and ***Golden Speed: The Geometry of the Square***, see my author page at the **Institute of Cosmological Economics** here: **https://www.cosmoeconomics.com/EZ/ice/ice/alexander-straker.php**

How to turn Small Accounts into BIG Profits like W. D. Gann…

Market Vibrations

W.D. Gann's *How to Make Profits* in Modern Markets

By Gordon Roberts

REPRODUCE GANN'S LEGENDARY RETURNS THROUGH LEVERAGED POSITION TRADING…

INTENT OF THIS COURSE

This course provide a trading strategy that allows for **large returns from low risk with an average risk:reward ratio of 1:10**, with returns of 500% per trade to some returns exceeding 5000%. The strategy employs powerful, straight forward analytical techniques explained in Gann's ***How to Make Profits in Commodities*** to identify high value trade setups which can be employed using highly leveraged options strategies to generate large but safe returns.

The analytical techniques and strategy **do not require any prior Gann knowledge** or any past trading experience. They can be easily applied by any trader, new or seasoned, to great effect with very little time or difficulty. The strategy is based upon **"leveraged position trading**" so requires little time or effort to manage. Minimum capital requirements are very low, so **someone with an account as small as a few $1000 can effectively implement this strategy**.

WHAT YOU WILL LEARN

- **Low risk, high reward trades averaging 1:10 risk:reward ratio!**
- **Trade setups with minimum 500% return & average 1000% return!**
- **BIG trade setups return 2000% – 5000% when they hit!**
- **Uses simple Gann-based analytical tools, easy to learn & apply!**
- **Strategy works with small trading accounts to make big gains!**
- **Uses classical Gann risk management and account management to produce the BIG returns like those Gann is famous for…**
- **A simple technique for beginners… a new strategy for seasoned traders!**
- **Online Forum for Q&A, and analysis!**

For a detailed write-up, Sample Trades & Author Introduction &Sample Text see:

GANN'S SYSTEM SCIENTIFICALLY EXPLAINED!

The Law of Vibration Series
Patterns & Numbers

EXPOSING THE UNDERLYING SECRETS OF W.D. GANN & DR. BAUMRING

by Dr. Lorrie V. Bennett

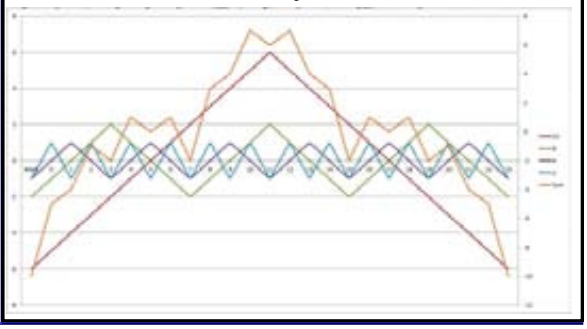

NUMBERS IS NOW AVAILABLE

750-PAGE PDF - PRINT ED. IN DEC!

- BOOK 1 - LOV BY THE PATTERNS
- BOOK 2 - LOV BY THE NUMBERS
- BOOK 3 - LOV BY THE PLANETS - 2021
- BOOK 4 - LOV BY THE GEOMETRY-23

NEWEST BREAKTHROUGHS IN GANN

This book will provide the initial unveiling of the **13 Sacred Numbers**, revealed in the secret code hidden in **The Magic Word**, that are the basis for Gann's cycle system and the natural law/logic behind them. Also within the works is the Periodic Table of Numbers which helps to reveal the "hidden octave" of the square root of two as well as the measures of **PHI** and **PI** and their source calculations within the very Structure of Numbers

Good Sleep is Important for Your Trading Success

By Larry Jacobs

Good sleep is Important for your trading success. A good night sleep is very important for both your health and your success as a trader. It is as important as eating health foods and exercising. Here is the reasoning behind good sleep and why it is so crucial.

1. Poor sleep is linked to gaining weight. Sitting in a trading chair and day trading all day and being over weight is uncomfortable. If you are uncomfortable you won't trade with success.

2. Good sleep will improve your concentration and your productivity in your trading. Sleep is important to brain function which includes cognition, productivity, concentration and performance. Sleep deprivation will negatively affect these. Traders who get at least 8 hours of sleep will generally not make the serious trading errors that one that is sleep deprived does. One study found that deprived sleep can negatively impact aspects of the brain function similarly to alcohol intoxication. Good sleep is shown to improve problem solving skills and enhance trading performance.

3. Poor sleep can give you heart problems and even a stroke. Lack of sleep can affect your health subjecting you to many chronic diseases. There have been many studies that found that if you don't get at least 8 hours of sleep to are setting yourself up for a health disaster.

4. Sleep affects your type 2 diabetes risk which affects blood sugar and affects insulin sensitivity.

5. Poor sleep is a direct link to depression. 90% of sleep deprived people are also depressed. Depressed traders usually are poor traders.

6. Sleep improves your immune function helping you avoid diseases which will eventually ruin your trading success.

7. Sleep affects your emotions negatively which will end up eventally in a trading disaster.

Sleep Blockers may be affecting your sleep ability. They are a group of 3 hormones that get released in your body generally in response to everyday stresses. They block your body's ability to relax and fall asleep. They put your body on high alert causing your body's mind to race making it impossible for you to go to sleep. It is possible to stop sleep blockers and then you can get a good night sleep.

There is a solution that stops sleep blockers by just by flipping a switch in the brain. Through scientific research there is a sleep switch product that uses natural ingredients that turns off the sleep blockers allowing you to fall asleep and stay asleep giving you a restorative deep sleep you need for trading. The product is called Exhale PM which allows people to fall asleep easier and stay asleep through the night without consistently waking up. For more information **click here.**

If you are a trader and is having sleep problems you need to try Exhale PM. You risk nothiing by trying it.

Yet the deep, restorative, peaceful sleep you've been craving could be moments away. And that your ability to fall asleep and stay asleep will only get better over time. The bottom line is that the longer you use Exhale PM, the better your story could be.

And you're covered by our "stress free" 180-day money-back-guarantee. So even after 6 months, you'll be able to get a full refund if you're not thrilled with your sleep. For more information **Click Here**

To Be a Successful Trader You Need to be Healthly

By Larry Jacobs

As traders most of our day is sitting down and not moving. We are constantly exposed to great stress almost like a air traffic controller. We need to perform at the highest level to be successful.
Sitting is not good for us. Researchers have found that traders who sit for long periods were more likely to die from health problems.

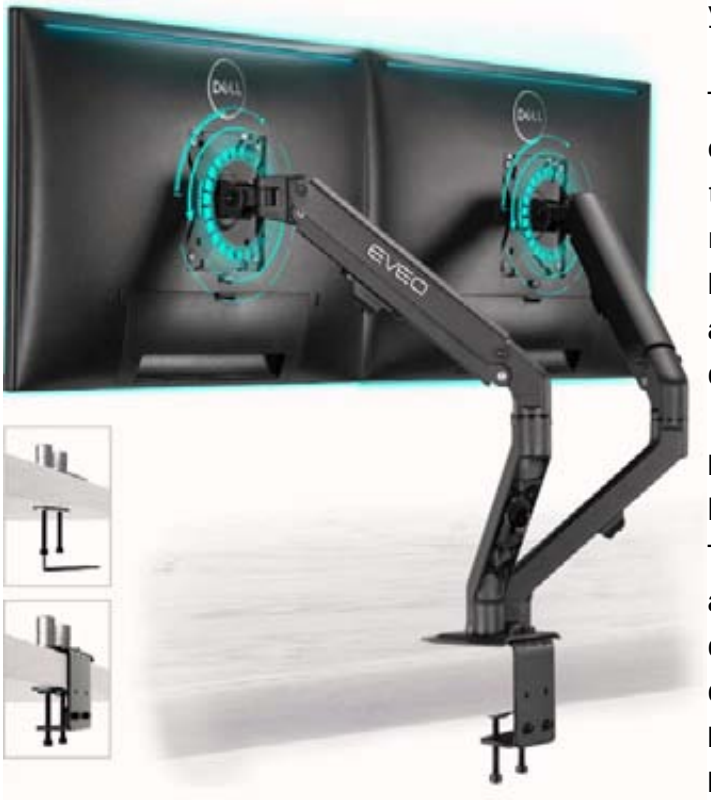

Research showed nearly 20% of people sitting all day have an increased risk of dying if

cardiovascular disease that involves the heart and blood vessels such as stroke and hypertensive heart disease. There is a 20% increased risk of getting cancer and dying from that. Sitting can also cause obesity, earlier death, muscular issue and even depression. Get a **standing desk**, it is better for your health. There are now many brands available. Also you might consider getting an **egro chair.** With a good chair you can maintain good posture for a long period of time.

However, you really need to have a balanced lifestyle. You need to exercise more than 30 minutes a day since you are sedentary for 23 ½ hours a day. Consider walking to get your exercise. I would recommend at least 7,000 to 10,000 steps per day. Also do some weight lifting to build

your muscles.

Traders are exposed to high stress from putting on trades and managing it until you close the trade. Stress is your companion that is the nature of the situation. Chronic stress and a lifestyle that is unbalanced can be disastrous for a trader. Did you know the 90% of illnesses and disease are related to stress.

Looking at computer screens all day for long hours affects your well being and your health. This can harm your melatonin production at night and lead to sleeping disorders, cardiovascular disease, cancel and impact our immunity to disease. Sleep is the most important thing to Restore and maintain your health. Consider using EXHALE PM.For more information **Click Here**

The purpose of this article is not to disturb you but to make you aware of optimizing your environment and help you minimize the risks.

You should screen setup to improve your posture and help your eyes. Consider also a **monitor stand**. It helps to position and get your monitors in perfect position

Use a **evoluent mouse** to emulated nature hand posture. Exercise your wrist to reduce negative effects of using a mouse.

Reduce the effects of blue screen monitors by using flu.x software that reduces the blue light of screens. Use anti-glare screens. Every 20 minutes give your eyes a rest from looking at the screens.

Try to have more natural daylight during the day. That can reduce sleepiness earlier in the afternoon.

Use stairs if possible. Take mini breaks frequently. Use desks with adjustable heights and stand up.

Timing Solution Forecast the Markets Instantly

Review by Larry Jacobs

The Timing Solutions module allows you to calculate fast and very easy the most important cycles of a market. It is very easily to use the program. After downloading the price chart you turn the cycle options on you want and watch for all these cycles come together with the price chart.

In this example I have clicked on **three options**:

1) The annual cycle (blue line) which is based on all available price history day. For example, if you have downloaded 20 years of price history, the program uses all that price history to calculate the annual cycle.

2) The fast annual cycle (red line) that is based on the last three years of price history data.

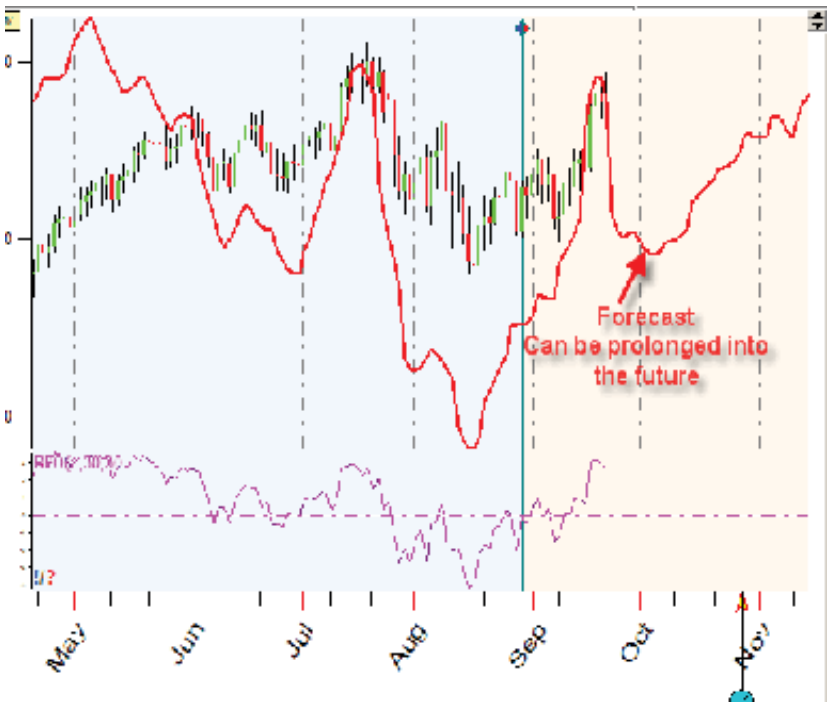

3) The annual decimal cycle (green line) shows a patterned annual cycle based on different patterns. The decimal pattern is what some researchers claim that the market repeats itself every 10 years. For example, to calculate the annual cycle for 2021 use these years 2011, 2001, 1991, 1981 and so on. I have noticed when all three cycle lines (blue, red and green) go in the same direction along with the green and red arrows at the bottom of the chart, the probability of price movement is even higher. Notice the S&P chart below. This is just a small fraction of what this software program can do.

For demo of the program **click here.**

Timing Solution

Forecasts the Markets Instantly!

Timing Solution generates projection lines based on fixed cycles, astronomical cycles and other types of models.

The software considers models that deal with natural cycles, cycles that are based on celestial bodies' movement.

The program analyzes tens of thousands of different planetary lines.

The Universal Language of Events module allows you to create more advanced models analyzing everything that occurs in time and researching the effects of these phenomena on the stock market.

❄ You can ask the program to reveal the most powerful cycles for your financial instrument.

❄ Special algorithm that reveals the freshest/newly appeared/strongest cycles.

❄ The program analyses all turning points, provides their statistical analysis and displays the most probable support/resistance levels.

❄ Charting Tools, Fibonacci levels, Pitchforks, Gann Angles and many other traditional charting tools are available.

DeLorean TIME Trend Almanac

Dow Jones

Rick Versteeg

In previous article we wrote*: Using our DeLorean indicator, we forecasted since beginning 2020 that Trump would win Presidential elections and that a crisis would unfold after November 3rd. Well, it was correct, Trump had a landslide win in the morning of the 4th, but suddenly counting was stopped in 7 states and magically they kept on finding many votes for Biden and few for Trump, which took ages, but in the end Biden was ahead. However, he won only 16% of all counties and 80(?) million votes, much , much more then Obama. When writing this article there is tons of evidence of massive fraud and still it could well be the case that Biden will win. Because democrat states do not want to investigate the ballots in full and judges as well as supreme court deny mostly of the evidence and fraud. Did you not know about the fraud? No surprise since Big media does not cover anything about fraud and evidence whatsoever. Nevertheless Trump can become the next president, since on January 6th our indicator is deep RED, right on time with the day that Congress will convene about choosing the president**. Let's see how this will play out**.*

Busy times

We will take orders for our special offer until April 14th. After this date you can send an email to be put on the waiting list.

Great Reset

First of all, I am not in favor of any political party, but in favor of the people who should decide, freedom and integrity. Which in my opinion society and government should reflect. So not against Democrats, since so many of them really try to build a better world.

Well, January the 6th was red and events did unfold accordingly. The big event was the so called insurrection and storming of the Capitol as pretended by the Democrats in Congress and senate supported by the big media.

Actually, police were escorting Antifa members, brought with special vans, into the capitol where magically the doors opened and just a few security officers welcomed the people to enter the building. The Capitol was not protected at all. January 6th, Republicans still had the power to order an investigation into the results of the election, but only around 12 Republican senators did not certify the election results and 40 did go along with the Democrats together with vice president Pence.

Consequently the **Coup was successful** and it were the Democrats who had planned an insurrection to gain full power.

Clearly there was no insurrection and the "Capitol breach" was staged to blame Trumps patriots, just like in 1933 when the Nazis set fire to the Reichstag themselves, blaming the communists. Thereafter the Nazis purged opponents, "won" elections, confiscated all weapons and Hitler ruled the next decade using executive orders. History in short, repeated now.

Just like the Presidents election, election of the last 2 senate seats on January 5th were "won" by Democrats in another blatant fraud in Georgia. Republicans were winning but they just injected 100.000 or as much votes in minutes as necessary to make sure that both Democrats came ahead, not even trying to hide.

The result now is that Democrats have a majority in congress now as well as in the senate with the help of Kamela Harris, who's vote decides when the outcome is 50-50.

In addition Biden has become a dictator using his executive orders. Now Trump is out of the way, Democrats are pushing - with incredible speed - new legislation (prepared years in advance) and budgets through Congress and senate to make sure that they stay in power (abolishing 1st and 2nd amendment, purge of Republicans and patriots) as well as trying to end democracy (Act for the people HR1, which legalizes all election fraud and violation of constitution as well as

History repeats itself

Firstly we calculate the energy of our time patterns at work for history and future . Next we research *which* time patterns in history had *what* effect on markets, economy or society it had in the past. History repeats itself in the future, doesn't it?

We maintain a pure quantitative approach meaning that we use a proprietary Physics Time database that calculates trends in history and future.

taking elections out of the hands of the states to the federal government) . Republicans are awake now but it is too late, unless state legislators will take back control and governance of their states.
In short the reset is on its way as the title of the previous article did say and we have entered a revolutionary period, which will give problems of unimaginable proportions and usually ends with blood in the streets.
The Blueprint of our yearly outlook prepared end of 2019 already forecasted this period. Read more in outlook 2021.

Time Trend Almanac

Forecasting the trend of indices using DeLorean indicator

Since we calculate DeLorean indicator way forward in the future, we can generate an almanac of future events with regard to the stock indices, in particular the Dow or SPX.
Trading system for active traders, no over weekend trading:
BEGINNING of month March 2021 the almanac of future events looked as follows:

The month of March is about to begin, so the DeLorean indicator is available with all its changes, but prices of SPX future we do not know yet. On average **SPX will follow directions of DeLorean indicator**! Therefore SPX will decline where the BLACK line of indicator declines. SPX will rise if indicator rises. In addition SPX will rise when indicator black line goes > 0 and SPX will decline when indicator goes < 0.
VERY IMPORTANT are the vertical lines in the chart on top. Clearly we have inserted these lines where we expect SPX prices to rise (any green or light green line) or decline (any red or magenta line).
These lines are inserted either at top/ bottom or when >0 or <0. Black vertical lines are skipped.
Consequently traders should be ready for a potential long after a green line and short after a red/magenta line.
Thus the lines in the chart depict the entries in our Time Almanac – with exact date and time of expected trend-when we put these in a table. *Please contact us if you like to see all entries in detail.*
THE END of March shows all trades that have been executed according to forecasted directions with simple entry criteria. TRADING 1 FUTURE LONG OR SHORT.

Profit 13k with 1 future es, 80% HITRATIO and 5.5 win/loss.
Entry conditions:
LONG: indicator **rising** again from bottom or breaking **0 up**.
AND price ES/SPX price **above** green line AND **wave 12 up** from bottom developing OR **breaking a price high up**.
SHORT: indicator **declining** again from top or breaking **0 down**.
AND price ES **below** green line AND **wave 12 down** from bottom developing OR **breaking a Price low down**.

Exit conditions:
initial stop 20-25 points, max stop 25 points, on acceleration penetration of the green line (EMA 15min)

Of course you can tailor make the trading system to your preferences. Remember to give the trade some space in the beginning, otherwise you will be stopped out time and again. Traders who have a stop of 5 points or so, will never make money and only catch noise.
What you do using the entry rules is to wait until the fish come to that point in time, which is found with DeLorean radar, where direction will change and you will be ready to catch them using your entry net. Without DeLorean (or any other advantage) you would not know when and where to throw your net, which would make it a gamblers game.

Inspecting the trades in more detail

Obviously, the entry and exit rules will not work profitably without the DeLorean indicator. You need an edge, a higher probability to make money. Most traders and investors say it is impossible to know the future. Why? Because they do not know themselves how and therefore neither anyone else.
If there is no advantage to be found why trading then? It is even worse than playing the roulette in the casino, where losses with each turn are limited, not so in trading.

This picture shows in more detail that green lines are either placed at the point where the black line breaks 0 upwards, so you can trade long only. Or the green line is placed at the bottom where the indicator starts to get stronger again. For shorts it is the other way round, below zero and the indicator getting weaker.
When the indicator stays more or less around zero or does not rise up strongly for a long trade, or vice versa for a short, it is called flat and neutral.

If you have questions, just send a mail.

The results from May 2020 until end of March was in line with above. See the chart below. Best way is to be selective because firstly you need some sleep and still enough interesting trades to profit from. You will have to practice the Wave 12 as a confirmation and make sure to get ready in time, but skip the night. What makes it a bit more difficult that You cannot trade it fully automatically. Also hectic markets are more difficult.

	Long	Short	Total
Total net profit	54,875.00	46,012.50	100,887.50
Total gross profit	57,212.50	52,262.50	109,475.00
Total gross loss	-2,337.50	-6,250.00	-8,587.50
Performance fee	0.00	0.00	0.00
Management fee	0.00	0.00	0.00
Total slippage	0.00	0.00	0.00
Total transaction costs	0.00	0.00	0.00
Open position P/L	812.50	812.50	812.50
Total # of trades	45	41	86
Number of winning trades	39	30	69
Number of losing trades	6	11	17
Percent profitable	86.67	73.17	80.23
Largest winning trade	4,837.50	4,562.50	4,837.50
Average winning trade	1,466.99	1,742.08	1,586.59
Largest losing trade	-987.50	-1,262.50	-1,262.50
Average losing trade	-389.58	-568.18	-505.15
Ratio average win/loss	3.77	3.07	3.14

this result includes the results of March 2021. DeLorean indicator makes the difference, generally 7/8 times right direction out of 10. Confirmation rules will normally take care not to enter when the expected trend is contrary.

Results same Time Trend trading during crash of 2020

	Long	Short	Total
Total net profit	6,350.00	25,637.50	31,987.50
Total gross profit	7,112.50	28,475.00	35,587.50
Total gross loss	-762.50	-2,837.50	-3,600.00
Performance fee	0.00	0.00	0.00
Management fee	0.00	0.00	0.00

Average losing trade	-381.25	-472.92	-450.00
Ratio average win/loss	1.70	4.01	3.04
Average trade (win and loss)	488.46	1,220.83	940.81
Average trade pts (win and loss)	9.77	24.42	18.82

In line with the last month March 2020, although the result was higher from beginning December 2019 due to large price movements.

Discovery of precise timing large trends

While the DeLorean indicator as well as the DeLorean Outlook 2020 and 2021 both did recognize uncertain times, difficult economic conditions and extreme US elections, it did not coincide with declining markets, which is exceptional. We all know that sometimes very large price movements seemingly come out of the blue. This time the blue wave was up. So, in spite of the fact that markets mostly move in line with movement of indicators, something was missing in between the daily indicator and long term indicator with regard to movements of markets.

If the daily trend of markets can be forecasted on a daily basis long before it happens, surely the same must be true for the big trends.

Necessarily I had to restudy our information to find the missing link.

And there it was when we were using time patterns of the Dow Jones as well. Logically time patterns (a sort of time cycle but much more complex) are everywhere, in our life, society, economy, markets, the US dollar, the Dow and so on.

When taking into account sensitive TIME points of the Dow, suddenly all large corrections were connected and more or less explained. Beginning with the correction that took place in 2020, the same parallels found in 2008, 1987 and the years from 1931 and more.
Also bull markets showed up with positive sensitive points (next to and together with to our Long term DeLorean, but together more precise).

To have some fun we will start experimenting with a forecast for coming April, which shows some similarity to 1987, so a quick and still large correction. It should reach a crescendo from 20 to 27th of April. Mostly, in all trends, there are 3 waves with the 3rd wave the strongest and some aftershocks.

Long term view on market

Markets need a correction. Price patterns already indicate that markets are struggling and might be building there last wave up in a 5th wave. A decline of SPX / Dow with 15-20% is in the cards as it seems.

SPECIAL OFFERS FOR Tradersworld readers. We advise SPX, which is leading. To order DeLorean and travel to the future:

Harnessing Grain Cycles – An Opportunity of a Lifetime

By Andrew Pancholi

Back in April 2020 - a year ago we discovered an active cycle that alerted us to a forthcoming major move in grain markets.

We forewarned our followers and they were prepared.

Let me explain.

One of the challenges with identifying macro commodity cycles is finding enough long term data to be able to make an accurate and statistically significant analysis.

In the perfect world it would be useful to have at latest 10 repetitions of any cycle that we wish to examine.

So if you are a looking at a yearly cycle you would want to examine 10 years of data.

The validity check of a thirty year cycle needs a 300 year sample.

Very few organisations have such long term data.

The 501c3 non-profit organization, The Foundation for the Study of Cycles is one. (www.cycles.org).

The legendary W D Gann also shows data sets in his "Bible", How to Make Profits in Commodities (www.wdgann.com).

Gann also kept a note of wheat prices all the way back to the year 1259. He is alleged to have travelled to England and derived this information from his studies at the British Museum.

Again this chart is invaluable and available from (www.wdgann.com) as part of their Commodities course. It behoves serious commodity traders to study such information.

Why?

An understanding of this information can afford a once in a lifetime opportunity to identify a forthcoming megatrend. Once that trend becomes active, it is difficult to risk manage. Professional money usually fuels it.

Often times, as in the 1970s wheat bull market, these events are “created” by alleged “Black Swan” events, such as sudden Russian intervention in this case.

As a student of cycles, I would say that there is no such thing as a Black Swan event. Such occurrences are cycles that others have been completely missed or are so long that they are difficult to identify due to their vast length and eccentricity.

In other words, there are not enough data sets to validate their existence.
Two such cycles are the 49 year and 50 year repetitions.

The 50 year cycle validates very clearly in markets.

In terms of the stock markets, 1857 saw global financial panic. This focused around America and also Europe leading to the closure of over 50% of US banks.

Adding 50 years to 1857 takes us to 1907 when America saw “The Knickerbocker Crisis.” This was also known as the Rich Man’s Panic.

Fifty years later, in 1957 the Dow Jones Industrial Average made a significant top.

Adding 50 years to 1957 takes us all the way to 2007 and the entire world was wrapped up in the Global Financial Crisis.

The story doesn’t stop there.

Heading back 50 years from 1857 takes us to the year 1807 and the American economy is devastated by the consequences of the Embargo Act. This was targeted intervention during the Napoleonic Wars.

Study of the novel, “Tunnel Thru the Air” by Gann shows the Jubilee cycle. This is a cycle of 7×7 which is 49 years. This is significant in Judaism. Debts are forgiven.

My research has shown that commodities tend to operate to this cycle.

Take a look at this chart of wheat.

The 49 year cycle is playing out perfectly - high to high and low to low.

As we examined this closer last year and also looked at some super long term cycles from Gann’s chart dating back to the year 1259, it became evident that we were on the verge of something very big. So we deployed our system.

We fine tune these cycles using a series of proprietary cycle techniques.

These allow us to identify turning points in different time windows.

By scaling from long term cycles down to daily cycles we can identify major moves in advance.

Take a look at this monthly chart of wheat heading back 20 years.

Under this chart are a series of histograms.

These histograms are predictive. In other words they are known in advance.

Where we see a forthcoming spike, we know that we can expect a change in trend.

Where we see these spikes on monthly charts we know that a significant reversal is likely. We use a series of charts. Ultimately this is all fine-tuned on daily charts.

Here is a daily chart of wheat in which we are running a double histogram set.

When we get a monthly cycle coinciding with a weekly and a daily cycle spike, we know we are not only likely to see a significant reversal, but we are often able to time it to the day.

As we teach in our trading courses, we want to safeguard our positions as we approach these potential timing points. We do this by taking profits, or tightening stops or fine tuning our hedging.

This gives us a distinct advantage.

We also have strategies for entering trades at these turning points by using tight risk management.

This is the methodology that enabled us to identify the June 2020 low.

We have a clear future point which could well identify the end of the wheat trend. It is already showing as very strong.

Here are the turns that our followers have known in advance and have been able to benefit from.

In this chart we are only showing the monthly and weekly turn points.

The monthly turn points are identified by the blue lines.

The weekly turn points are shown with the green and red arrows.

Note how they have identified pretty much all the major turns.

\\

This information is invaluable to all commodity traders.

Whilst it's not perfect, it does provide you with a distinct advantage. Accurate timing means optimal risk management.

This timing is also very effective in confirmation of Commitment of Traders signals.

The signals are especially powerful for confirmation or potential failure of seasonality.

Here is our wheat seasonal profile from our Professional Traders Platform.

We show two lines.

The blue line shows the regular season path of wheat.

The yellow line is our more dynamic seasonality using a proprietary formula.

Both patterns show lows at the end of June/beginning of July. See red arrows.

Now look at the preceding chart.

You will note that we had a weekly time cycle for that very same time window.

This meant we could expect a reversal.

The market was heading down and so we were looking for a low.

Seasonality was also telling us to look for a low.

And that is exactly what happened!

How would this information benefit your trading and investing?

For a short time only we are offering a 25% discount on these invaluable Grain Timing Reports. There are three separate reports covering Corn, Soybeans and Wheat.

I wanted to share with you and your team the success that I've been having since implementing your system and your Market Timing Report.

I'm very thrilled to share that over two days, I paid for your entire course and one years subscription through commodities trading and following the system. It was huge !

However, it doesn't end there. Through your risk mitigation strategies, I was able to protect myself when the market turned a few months later. It was a game changer that previously would've sunk me.
I highly recommend your course, your system and your market trading reports to those who are serious about taking control of their financial success.
Ketan Ladwa, Serial Entrepreneur, Vancouver Canada

"I've known Andrew for a number of years. He knows cycles better than anybody I've ever met, and I've studied cycles all my life."
Harry S Dent
Renowned Forecaster and New York Times Best Selling Author

Andrew Pancholi is a world-renowned trading expert specializing in market timing. With over 30 years of experience in navigating the financial markets, he is the creator of the highly acclaimed 'Market Timing Report' (MTR). The MTR is based on output from the proprietary Cycles Analysis software system that Andrew built and uses to predict turning points in markets way ahead of time, right down to months, weeks and even days. When combined with seasonality, Commitment of Traders data, sentiment or fundamental anaylsis , these timing points provide highly accurate low-risk setups.

Andrew gained his expertise by the lifelong study and development of the strategies and theories created by some of the trading industries' greatest names such as W D Gann, Edward Dewey and Ralph Elliot (Elliot Wave). He is a renowned author, assisting in cataloguing the official W.D Gann material. He has co-authored the book W.D.Gann's Unpublished Coffee Course. He is the co-author of the Number 1 bestselling book Zero Hour.

Down to the day forecasting is commonplace for Andrew. His followers were given the date of the 2020 market high weeks in advance. He called the major commodity bull markets of 2008 and 2010 as well as the 2007 Global Financial Crisis and many other events. Both profiting and also helping others build wealth from being on the right side of major market events, his forecasts include the forthcoming currency crisis and commodity bull market as well as the modern day revolution that is hitting the USA. The Market Timing Report Trading Courses have received rave reviews. His work has been recognized and he sits on the Board of The Foundation For The Study of Cycles. The Foundation was set up by the US Presidency in the 1940s.

Trading and Investing Personality

By Thomas Barmann of NeverLossTrading

Summary: Does your personality determine the ability for trading and investing success? Or what is needed to turn you into the trader or investor you want to be?

Welcome to financial markets: an exciting space of opportunities, but do you need to bring certain personality traits for being a trader or investor?

You cannot save your way to financial freedom; however, trading and investing can pave the way to it.

The financial markets are "the" equal opportunity workplace in the world: age, race, gender, religion, pre-education, political beliefs, civil status… do not matter or make a difference, but what makes a difference?

Let us start with a question: What makes you who you are?

You most likely have an idea of your own personality type — if they are bubbly or reserved, sensitive or thick-skinned.

In psychology, to specify who we are, personality is defined as individual differences in the way people tend to think, feel, and behave.

There are many ways to measure personality with a focus on **personality traits.**

The most widely accepted of these traits are the big five:

- **Openness:** a person's intellect or imagination
- **Conscientiousness:** the desire of an individual to do the task correctly
- **Extraversion:** openness to external interactions or prefer being low-key
- **Agreeableness:** considered as benevolent, trusting, helpful and willing to compromise for the greater good
- **Neuroticism:** the ability to feel negative emotions like anxiety and anger

Big Five Personality Traits Diagram

Depending on the profession or whatever you want to achieve, personality traits might be supporting or hindering your endeavors.

When we come to trading and investing, the positive news is: some of those personality traits are not essential success components.

The difference between trading and investing lies in the time of keeping a position open; decision-making and behavior are the same.

On-time, I got asked: << Do you think that there are natural born traders? >>

My answer: >> I have not met one yet who was not born! <<

Meaning: >> What is needed to be a trader or investor is not genetically or personality determined; it is teachable and learnable. <<

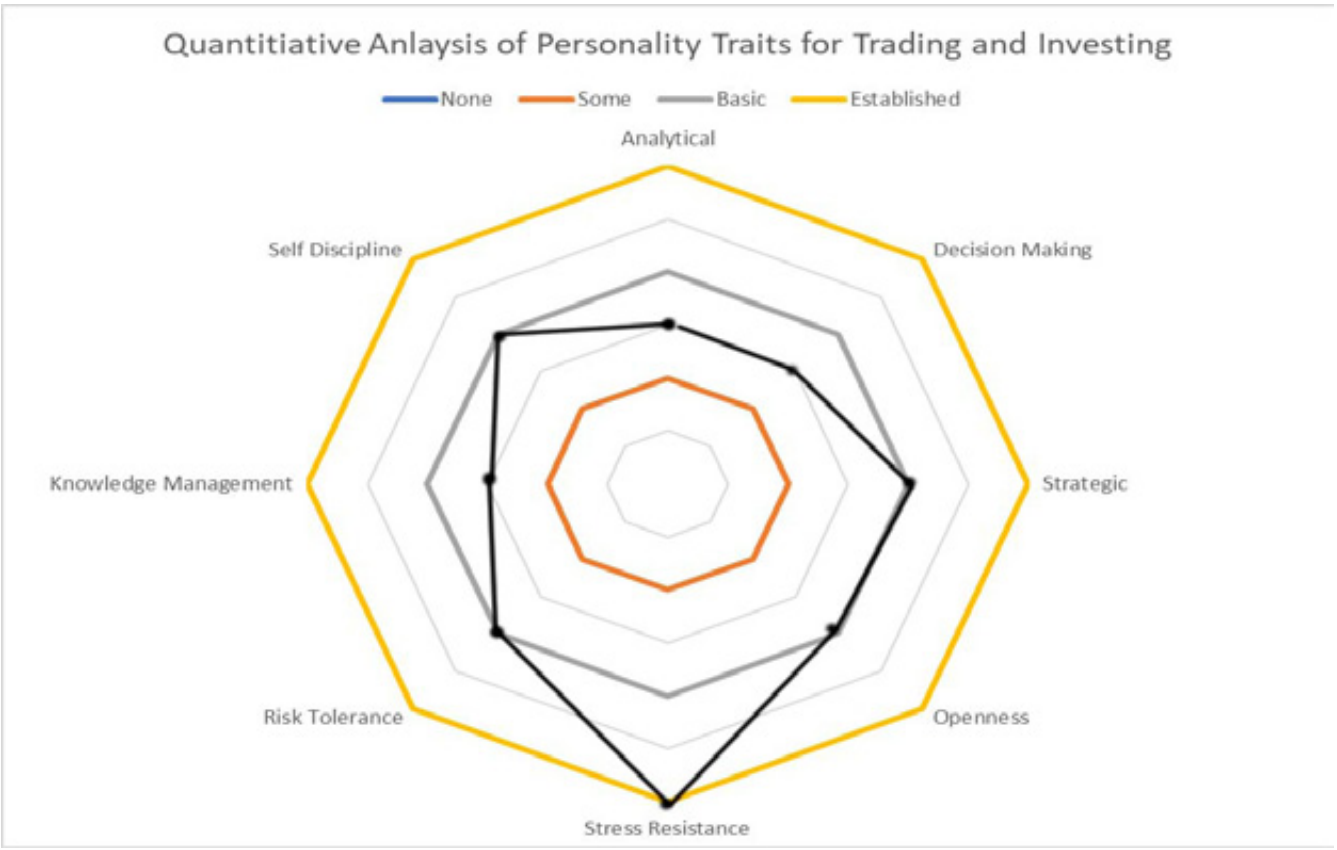

To explain what is needed, we want to share multiple personality traits that help or hinder your trading and investing success:

1. **Analytical:** Logical, systematic, mind driven
2. **Decisions Marking:** Responsibility-taking, doer
3. **Strategic:** plan/concept focused, longer-term oriented
4. **Openness:** Accepting and living with changes
5. **Stress Resistance:** Anger management, fear handling
6. **Risk Tolerance:** Affinity to the risk and risk handling
7. **Knowledge Management:** Gaining, adding, adjusting knowledge
8. **Self Discipline:** Prepared, focused, repetitive

We can put those on a scale for you and dimension your trading and investing profile:

Here an example of how to specify the current status on this diagram:

However, this diagram does not indicate what is needed for moving into the arena of success expectation, which is precisely the challenge we take: Getting you in the winning expectation zone.

To demonstrate what we mean by that, we quantified the individual trading/investing personality traits to build a linear function, where each trading and investing personality trait is evaluated in a scoring model with the following scales.

- 0, if nonexistent
- 1, for basic
- 2, for advanced
- 3, implemented or established

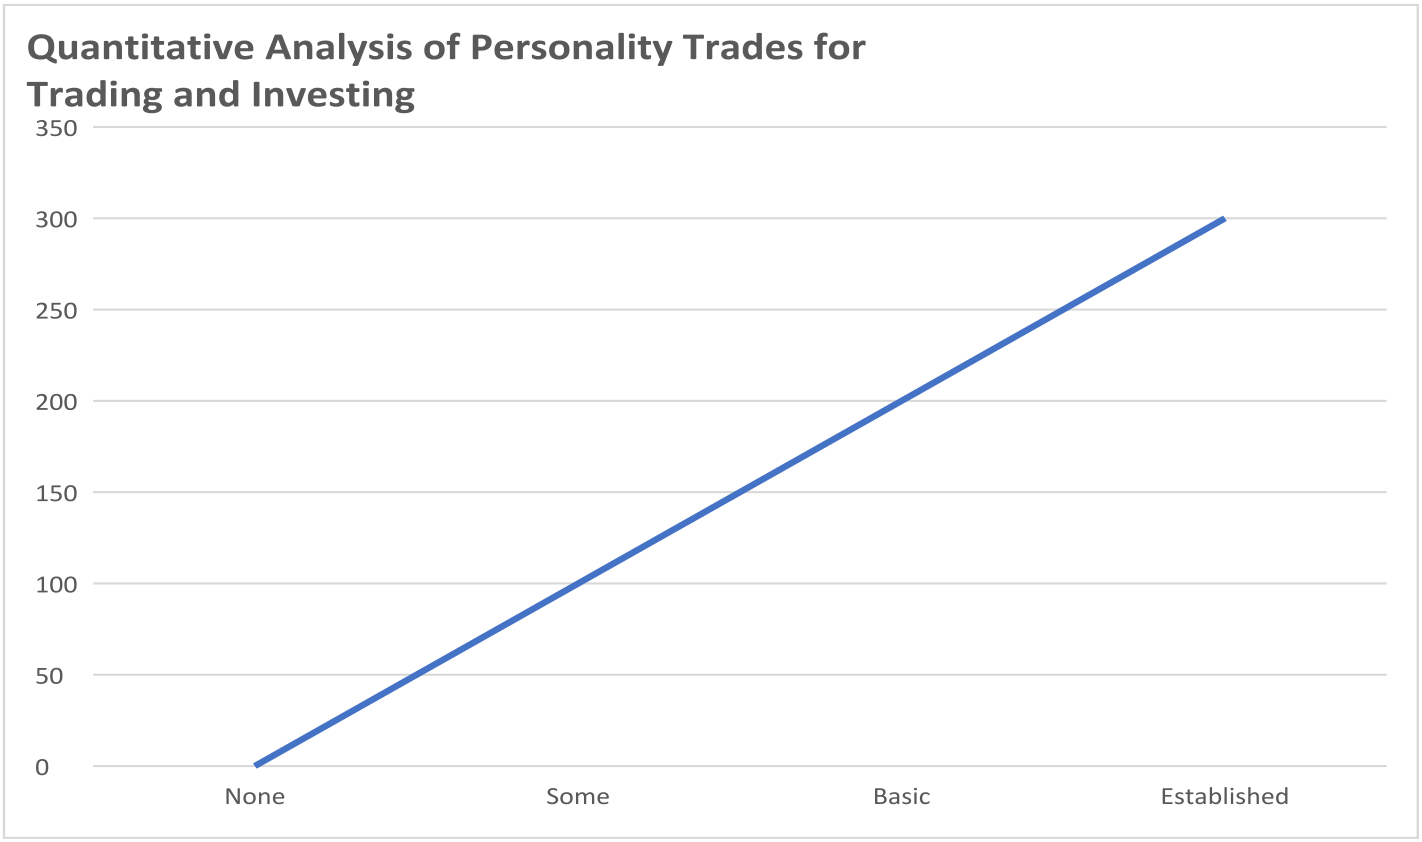

Each factor has a percentage weight relative to the importance. The actual score is calculated by multiplying the weight x 100 x the score. The following table expresses the max value of this calculation.

In the next step, we will build a function and highlight minimum requirements for entering the zone of being prepared or having supporting personality traits for trading and investing success. Then we compare actual ratings to minimum requirements.

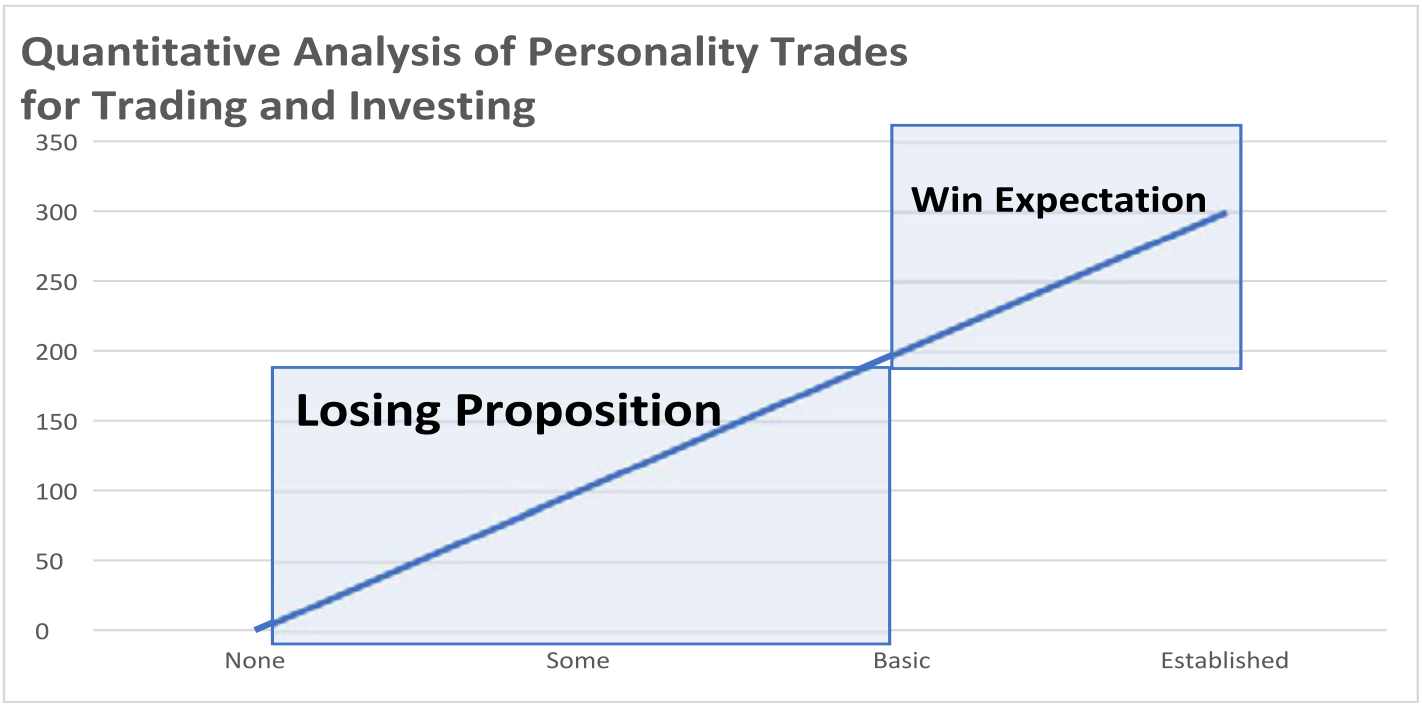

Quantitative Model to Evaluate Trading and Investing Personality Traits

Personality Traits	Explanation	Weight	Score	Max
Analytical	Following system based decisions with a high probability trading system, rather than following stock tips and emotions	20%	0-3	60
Decision Making	Clearly defined entry and exit conditions for trading and investing decisions	20%	0-3	60
Strategic	Long-term and short-term strategies for all type of accounts: 401(k), IRA, Margin	10%	0-3	30
Openness	Accepting change as a constant happening and adjusting to change	10%	0-3	30
Stress Resistance	Handling losses as part of probability thinking and staying with a system at times of trouble instead of fleeing to the next.	10%	0-3	30
Risk Tolerance	Systematic, percentage-based risk distribution approach instead of gambling for one big win and accepting drawdowns	10%	0-3	30
Knowledge Management	Competency in the subject matter of trading and investing by knowing and applying multiple risk-limiting strategies	10%	0-3	30
Self Discipline	Being prepared to trade, but do not trade to trade: Waiting prepared for the pre-defined situation with mechanical acting.	10%	0-3	30
Total		100%		

Based on a weighted scoring model, a function between 0 (nonexistent) towards a max score of 300, extrapolated as follows:

A simple looking function, but where are the crucial points?

In essence, you need to score above 200 points for having a chance to produce long-term trading and investing success.

Let us pick an example of an average private trader/investor:

Scoring Model of an Untrained Trading Personality

Personality Traits	Explanation	Weight	Score	Total
Analytical	Low probability decisions, stock tips, or emotional entries	20%	1	20
Decision Making	Price-move-dependent entries and exits with no pre-defined rules	20%	1	20
Strategic	Money manager dependent on 401(k), IRA. Trading focused on margin accounts	10%	1	10
Openness	Fixed way of acting mostly only going long on specified situations	10%	1	10
Stress Resistance	Changing systems when losses occur	10%	1	10
Risk Tolerance	Fixed investment size: 100% invested long-term, partially invested short-term	10%	1	10
Knowledge Management	A limited number of trading/investing strategies, not oriented towards risk-limiting strategies	10%	1	10
Self Discipline	Trading and investing when time or preference allows	10%	1	10
Total		100%	8	100

With a score of 100, this trader is not fit to produce long-term success. The minimum threshold to reach for entering the zone of trading and investing success is ≥ 200.

Behavior change and support in multiple personality traits are critical for making money from the financial markets. At the current stage, the above-described trader is not ready to compete.

Trading and investing can be learned, but multiple critical personality traits need to be built to give you a chance.

Adults often resent such feedback, feeling fit for everything; however, we want to caution you, money goes quick in the financial markets and those who fail to prepare, prepare to fail.

All of us can think back at school times; either you made the score or the team, but we had to pass minimum requirements. However, you are not boxed in; you can develop your personality to strive for what you want to achieve. This reminds me: I know an old friend since elementary school, lost track, and not long ago, we met again on Facebook. He is an airline pilot. As a child, he always had the most horrible grades by not putting effort into schoolwork, but at one point in life, he decided to change and got himself fit for what he wanted to achieve.

The same counts for trading and investing; you can build yourself up for what you want to achieve. But take some training: My friend would not have ended up as an airline pilot with a well-known airline by self-studying.

There is a danger, entering the markets unprepared: The incumbent market players welcome you to lose your money; no need for you to pass a test or minimum score.

We did a study, and a frighting 76% of the retail traders are losing money:

If you want to read about the reasons why this is, write us an email to contact@NeverLossTrading.com, Subj. 76% and we send you the article and data to back up this frightening fact.

The good news: We can provide you with all components for building up your personality traits, reaching from system to account management. Such, we offer to work one-on-one with you, focusing on your wants and needs, building up your skillset and knowledge to develop you into the trader and investor you want to be.

The investment that pays the highest return is the investment in you: We provide individual training units in the price range of $2,647 to $9,997 and offer multiple systems and time units for working together:

- TradeColors.com is our introduction unit into algorithmic trading.
- NeverLossTrading Top-Line is the top of the line, providing the strongest and frequent setups to execute on.
- Multiple in-between systems work as stand-alone or in combination with other systems.

About 50% of our clients buy more than one system from us.

Why do they do so?

After earning the tuition for the first mentorship, they want:

- A higher participation rate and return from trading
- More knowledge
- Further, expand their skillset

Basing your trading and investing decisions on defined rules is learnable, and we are here to support you!

Experience live how our systems work and find out which one is best suited for you:

+1 866 455 4520 or contact@NeverLossTrading.com

Schedule your consulting hour! Working one-on-one spots are extremely limited: Do not miss out!

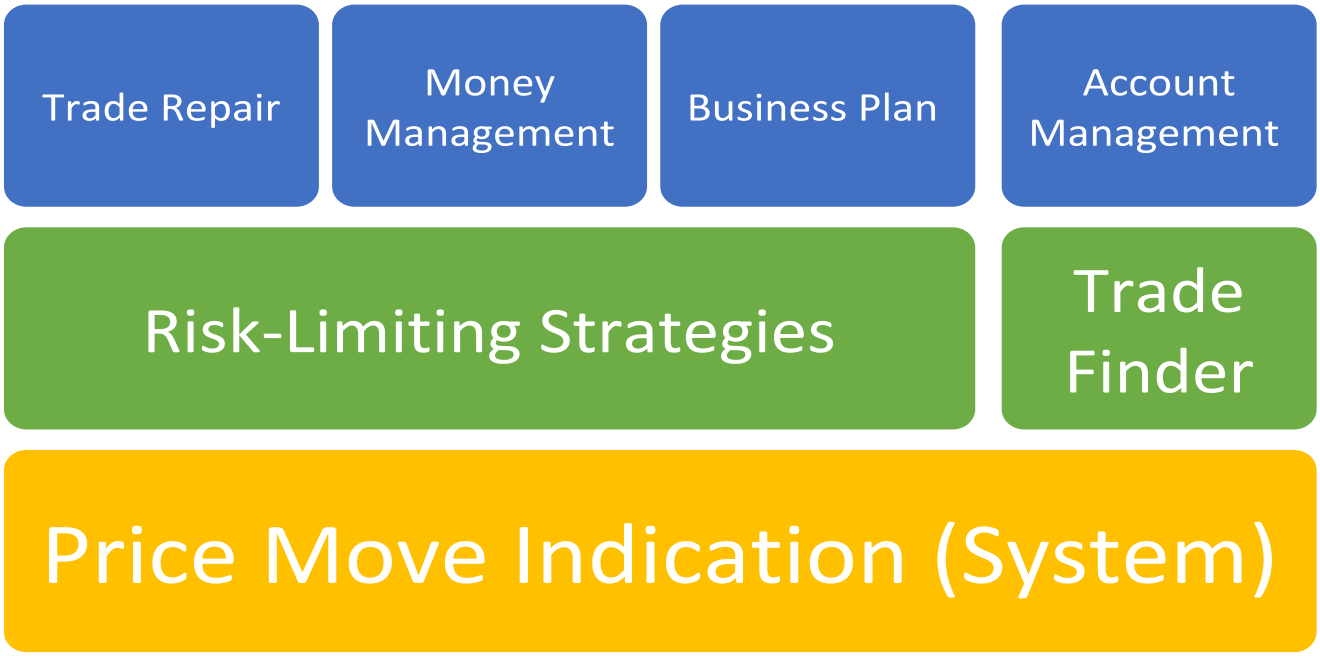

Trading and Investing is learnable...here is what we want to do to build up your personality traits:

Scoring Model of a Trained Trading Personality

Personality Traits	Explanation	Weight	Score	Total
Analytical	Learn to work with high probability trading systems that paint potential price turning points on the chart for you	20%	3	60
Decision Making	Know at entry, your exit and stop, the reward and risk of every trade, and how to execute those orders	20%	3	60
Strategic	Learn to manage your money in all accounts: 401(k), IRA, and margin accounts	10%	3	30
Openness	Experience and prepare that change is constant in the financial markets and how to cope with change (builds with experience)	10%	1	10
Stress Resistance	Build your stress tolerance by operating with high probability setups and learn on the go I(builds with experience)	10%	1	10
Risk Tolerance	Operate with a percentage-based, odds based investment scope	10%	2	20
Knowledge Management	Learn and operate with multiple risk-limiting strategies and trade on upside and downside price moves	10%	2	20
Self Discipline	Learn to prepare every day for accepting trades, but only take them when they meet your pre-defined conditions	10%	2	20
Total		100%	18	230

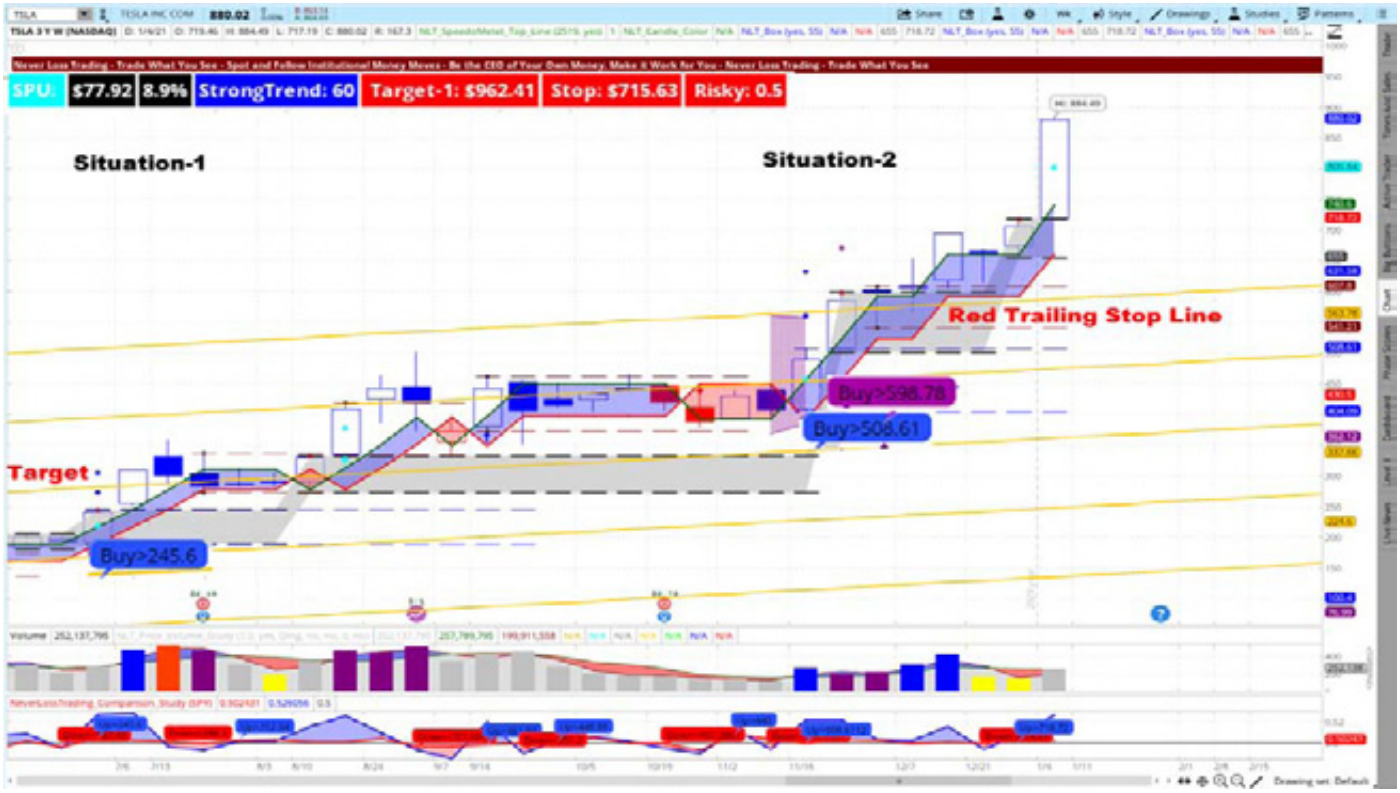

Some of the personality traits needed to achieve a score ≥ 200 take time and experience. We are here to work in our mentorships for extended periods to help you develop yourself into the trader/investor you want to be, tackling the subject matter in a holistic approach:

Dimensions of Knowledge Building and Behavior in Trading/Investing

Our charts and indicators build the basis, but as you can see, there is more to learn and teach than just following price indications. Here an example of how our most sold system: NeverLossTrading Top-Line chart looks like:

TSLA Weekly NLT Top-Line Chart

The chart shows two trade situations:

Situation-1:

Buy > $245.60 into earings in July 2020, concluding the trade at target-2 (second dot) with profit.

Situation-2:

You see two buy signals: blue and purple. The NLT Purple Zone shows a sign of a potential directional ambiguity. Such we would not trade the signal: Buy > $508.61; however, the second signal Buy > $598.71 showed that ambiguity is over and a strong upside price move was expected, which we trailed with the red line on the chart, exiting at the close of the candle of week-1 of 2021. Our rule says: a price move that starts in an NLT Light Tower (candle with a cyan dot inside), often ends in a light tower (last candle on the chart), and we can trail the upside price move.

Crude Oil on the NLT 20-Minutes Top-Line Chart, Jan. 2021

Situation-1:

End of price move ambiguity with Buy > $52.05, confirmed by another signal: Buy > $52.33, to be trailed with the red line, exiting the trade at the NLT Light Tower on the high.

Situation-2:

Reversal price move indication: Sell < $52.51. However, this signal was not confirmed by our rules, but a two same color candle setup built on the chart that

was validated and followed by the red stop line or exited at a 2-SPU price move to the downside.

You see, we work with clear-cut traffic rules to prevent accidents when entering and following a price move. We share all of this in our training sessions and tune our programs to focus on building up your personality traits, getting you fit for operating in the financial markets.

For Day Traders, we just developed a new concept based on NLT Trend Catching. You trade multiple times in a developing price move, reducing decision making to a minimum and eliminating time as a deciding factor; thus, we call the new concept: NLT Timeless Trading.

NLT Timeless Trend Catching Chart for Crude Oil Futures

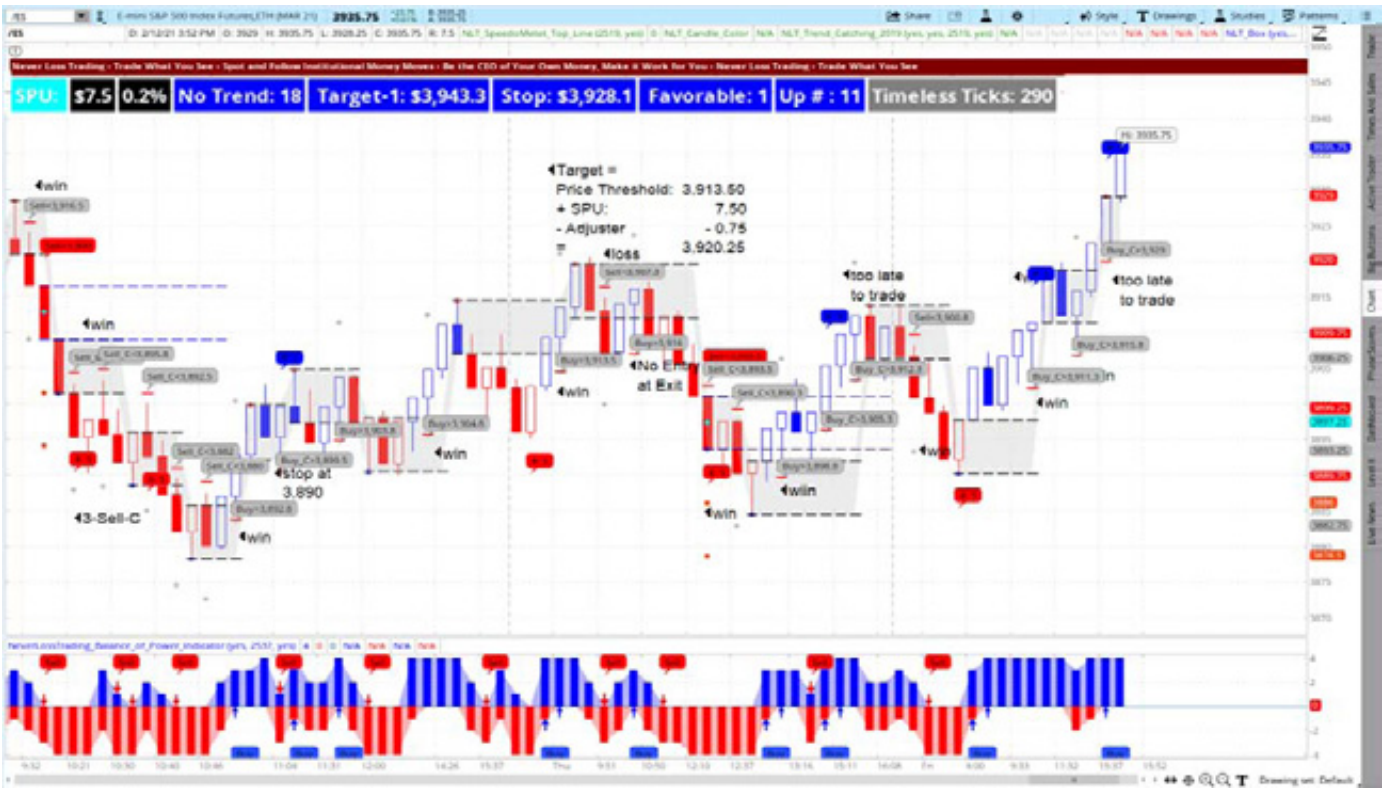

Ten confirmed trade situations along with the price development of the underlying, trading for a price change of $0.24 or a value change per contract of $240:

- Eight winning trades (80%)
- Two losing trades (20%)
- In total: a profit of $1400/contract
- Observed time frame: three days (Feb. 10 to 12, 2021)

The new NLT Timeless Concept works for every asset, either as a day trading or swing trading concept. Next, let us demonstrate an example for a stock market index: E-Mini S&P 500 Index.

NLT Timeless Trend Catching E-Mini S&P 500 Futures

In the observed three days, we had:

- Nine winning trades (90%), each for 7.5 points
- One loss for 8.25 points
- A gain of 59.25 points or $2,962.50/contract

Experience live how our systems work and find out which one is best suited for you:

WealthCharts: New with Advanced Analytical Features

Review By Larry Jacobs

WealthCharts has many cutting edge features and indicators for traders and investors. It has an excellent news feed combined with research and algorithmic scanners which are perfect for both beginners and even advanced traders. It includes live streaming as well as pre recorded educational content from various trading and investing experts. The platform is designed to help solve the problems that today's traders face.

This platform is quite nice, offering traders access to many more powerful analysis tools that are not available anywhere else. Up to now traders would have to buy access to several platforms to get the tools they need to be successful, but WealthCharts brings together the latest trading tools necessary to help traders make informed decisions. All of these benefits are available with an affordable monthly or annual membership.

WealthCharts brings together advanced features in an browser based platform, providing the right tools with easy to use charts and algorithmic features. Users can access WealthCharts with a PC or Mac or iOS/Android mobile devices.

WealthCharts gives traders an easy to see analysis of the market with the best data resources. This provides a strong understanding of tools that can make a real difference in trading success. Because WealthCharts offers a great variety of everything traders need, users have reported that they have canceled several other memberships and consolidated with just one platform. It is no longer necessary to hop between multiple platforms to get the same results which reduces the time spent researching trade ideas.

Using the automated WealthFinder tools allow users to fire up WealthCharts and instantly see many trading opportunities to review.

The Option Hunter activity scanner is also included for options traders. It rapidly identifies very unusual option activity that traders need to be aware of to be successful. It also includes several proprietary and advanced algorithmic scans and filters to make finding high probability trade ideas much easier.

The features that standout in WealthCharts are:

1. **The Option Hunter** that gives you full access to institutional and unusual option activity so you can identify potentially profitable option trades. This activity often precedes a move in the underlying stock and thus is an important source of information, even for non-options traders.

2. **Options Mapper -** An at-a-glance, ranked sorting of the symbols which have triggered the greatest number of options activity signals, keeping you informed of where the noteworthy money flows are taking place in the market. Even traders who don't trade options take advantage of this unique perspective on where the opportunities are in the market and where the smart money is moving into or away from right now!

3. **Algo Hunter** which allows you to plug in the types of instruments you trade such as stocks, options, futures, ETFs, or cryptocurrencies with your preferred trading time frame allowing the advanced algorithm to find the best rated trading opportunities that meet your criteria, saving you a bunch of time.

4. **Portfolio Analyzer** tracks your existing positions and, based on the platform's best performing scanners, provides projected price action for multiple timeframes to better prepare you for the market moves that will have a big impact on your positions.

5. **WealthCharts Research Team** provides you with trade ideas generated from the internal WealthCharts analysts as they review options activity to find the most interesting trading signals.

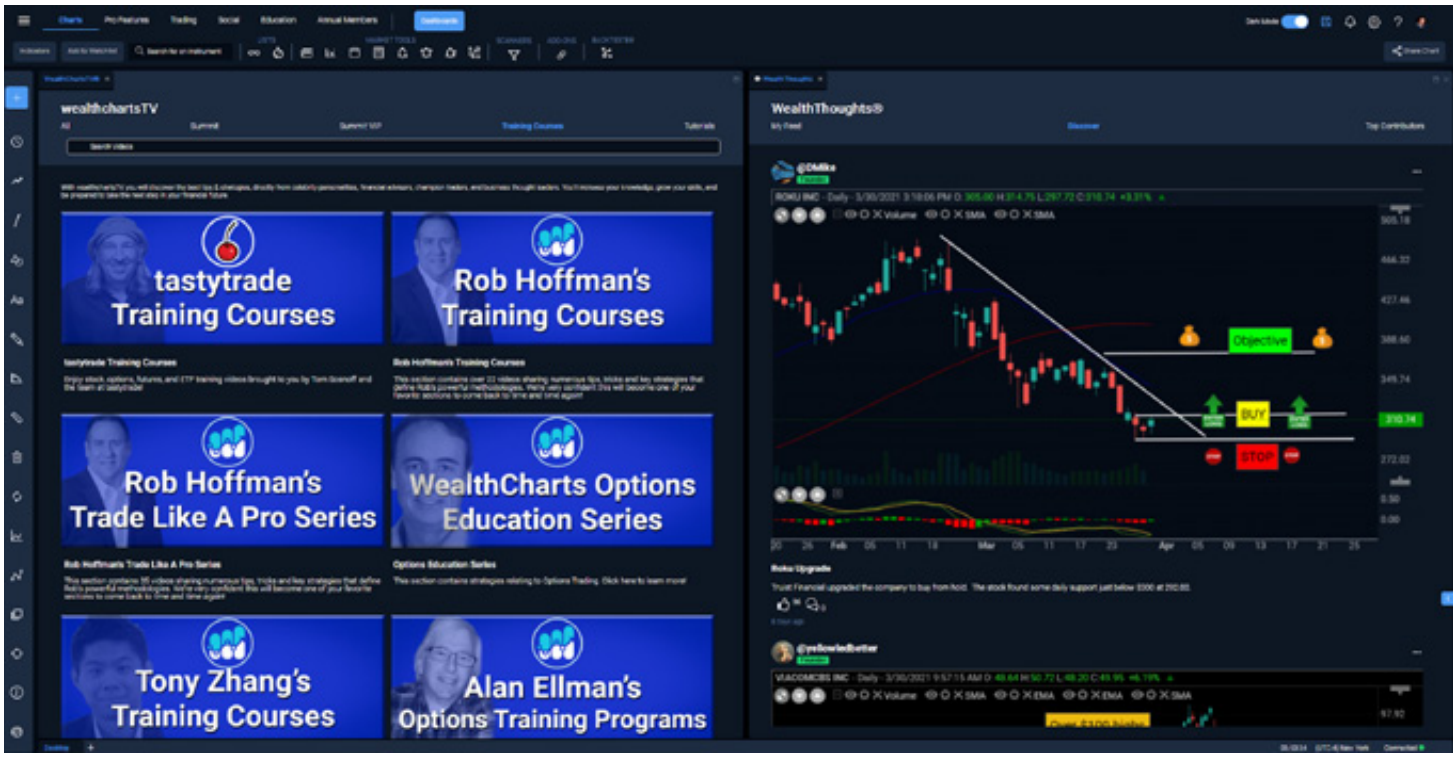

6. **Multiple Scanners** which use algorithmic trading intelligence to identify high probability trade ideas. In addition to popular scanners like the Ichimoku Cloud scanner that they have taken to a whole new level, WealthCharts also features a number of proprietary scanners like the Wealth Strength Index (WSI) and WealthFinder, which provides actionable research to quickly identify higher probability trade ideas. Most recent additions include the STARC Bands scanner and a Weekly Reversal scanner with numerous others being developed as of the writing of this review.

7. **Pre-Market Live Stream Prep** offers an extensive pre-market review to help give you insight into daily market events to understand and prepare for them. Led by very popular live market educators, it covers day, swing, and position trading along with reviews of world markets and several of the most popular asset classes.

8. **Brokerage Integrations** allows you to access live data and then easily execute trades through one of the several domestic and international brokers that WealthCharts supports, allowing users to trade stocks, options, ETFs, futures, FOREX, and cryptocurrencies right from the WealthCharts platform.

9. **The Best Technical Tools** integrated directly into the platform, thanks to extensive partnerships with top traders from around the world. In addition to the extensive library of more than 160+ indicators and technical scanners currently available to Founder members, new indicators are constantly being developed and added to the WealthCharts platform.

10. **WealthCharts TV with advanced training** content by expert traders and investors to help you build your trading skills with on-demand training courses, various livestream classes and archived sessions from the many Wealth365 Summits. WealthCharts has invested a lot of time into training their members with daily live streaming support sessions which helps to build a strong community of traders.

11. **WealthThoughts** allow the WealthCharts community to share trade ideas with each other and get feedback from fellow users. You can post your own trade idea, comment on the ideas that other users have posted, and even compete for a place on the WealthThoughts leaderboards, where top ranking posters are highlighted as a result of the popularity of their ideas within the community.

Rob Hoffman is the genius behind WealthCharts. He is a 30X international and domestic trading champion who has the fame and title of winning more real-money, onsite-trading competitions than anyone else in the world. He is a trader, educator and mentor and has developed world-famous indicators which he has used to help him win many of his trading championships. Some of those same indicators are now available in WealthCharts.
WealthCharts has packed thousands of dollars worth of value into its membership, including research, education, indicators and scanners, all for just $197 per month. They have a team of developers who are constantly adding many new benefits and enhancements to the platform based on user feedback and Rob's experience as a trading champion. We highly recommend WealthCharts.

Gann Grid Masters 2.0 Packages for 2021

Hello

My name is Robert Giordano and my approach to trading is simple, it's similar to that of professional gamblers as professionals understand, trading must be understood just as a pro gambler knows his chosen game.

Over the years I found many pro traders had the uncanny ability to know how and when to place trades that would raise profits while at the same time lower the house odds down to an almost even keel. Each did this by mastering several single systems or ideologies found by trial and error research and applying each at the correct time. This odd stacking concept gave many the much needed edge to stay alive and actually profit from over the years.

So in a nutshell "Professional Traders" are professionals because they know how and when to stack the technical odds first, before placing a trade.

You too must learn to stack the technical odds first, or like all forms of gambling the casino will always win in the end.

With this in mind, I feel the tools incorporated within our "New" 2020 Gann Grid Master's 2.0 will allow it's users to do just this!

The Gann Grid Master's Software

The Gann Grids charting software allow its users to test many technical, astro-technical and cycle research methods on screen with the simple click of a button.

Our unique and specialized applications are designed specifically to help test many of the highest percentage worthy single system many past technical masters had to offer.

Our software not only allows its users to draw most stock, commodity and

index on a large number of harmonically perfect grid chart sizes just as had done by hand many years earlier, but also allow to test most of the Gann, Bayer and Elliot's research concepts on screen with a simple click of a button.

Days, Weeks or even Months of research can now be completed within a few seconds with our new, improved and impressive version of Gann Grid Masters

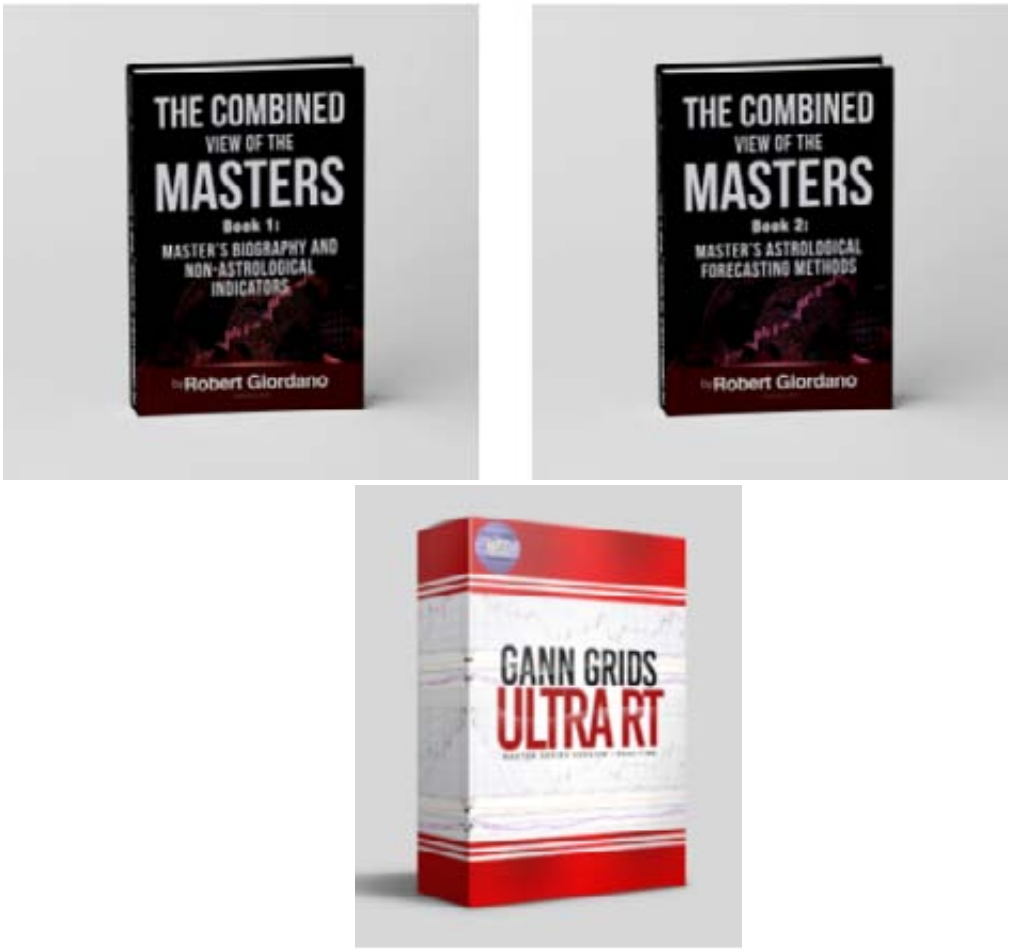

YouTube Video featuring 2 full hours of software applications !

Gann Grid Master's Video 1, Several Non-Astrological Applications

https://www.youtube.com/watch?v=34S35Vv3f5E&feature=youtu.be

Gann Grid Master›s Video 2, Several Astrological Applications

https://www.youtube.com/watch?v=JkIZE4Z2As0

Package 1,
Real-time software version 2.0, Combined View of the Masters 2 Volume series (pdf) and 3 full hours of private 1 on 1 online training!

Package # 1, Pricing $1200.00

Package 2,
Real-time software version 2.0, Combined View of the Masters 2 Volume series (pdf), several out of print books unique to the traders highlighted within 2 book series along with 15 full hours of private 1 on 1 online training !

Package # 2, Pricing $2750.00

For booking, time slot availability, payment options or questions; please contact me direct at;

Pvtpoint@aol.com or log on to www.Ganngrids.com

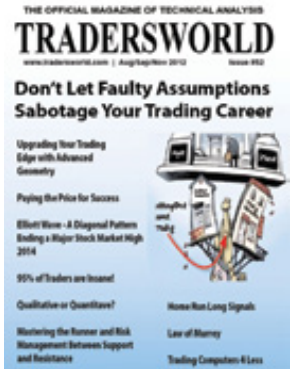

Thank You

Robert Giordano

Dominant Cycles in Investment Managers' Exposure to U.S. Equity Markets Indicate Impending Turnaround

By Lars von Thienen, www.whentotrade.com

The importance of analyzing sentiment cycles of active money managers plays a critical role in assessing financial risk. Dominant cycles in the National Association of Active Investment Managers Exposure Index have been identified with high correlation over the past 15 years. The current state of the dominant cycles indicates a possible reversal for U.S. equity markets.

Back in 1949, investing legend Benjamin Graham eloquently characterized the cyclical nature of financial markets in his book "The Intelligent Investor":

"The market is a pendulum that forever swings between unsustainable optimism and unjustified pessimism."

Today, the emerging field of social media sentiment datasets support Graham's point of view, providing a strong empirical foundation for the overreaction bias that is often the driving factor in cyclical markets.

Normally, social mood waxes and wanes positively and negatively. Thus, sentiment waxes and wanes in the form of dynamic cycles. Mood refers to a feeling, emotion, or attitude about something, and, of course, it can have a range of values. Whenever mood is related to corporations or the economy, the character of events will unfold in the related financial assets. Fear and despondency represent one extreme, while thrill and euphoria represents the other end of the spectrum.

Cycles are the important structure because sentiment does not jump rapidly from one state to another.

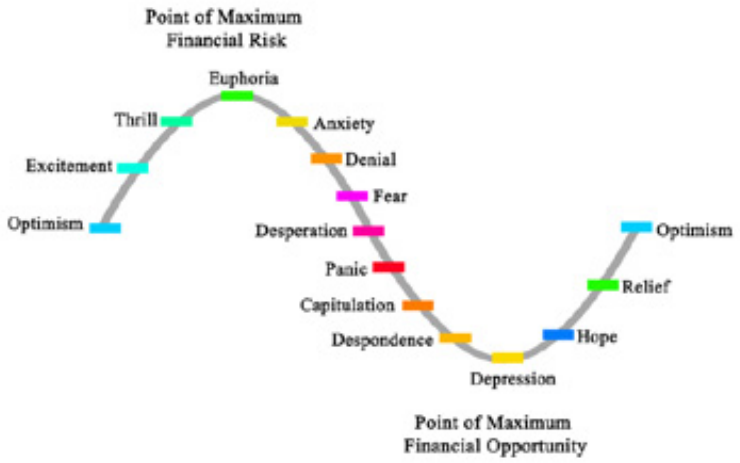

Chart 1: Market cycle that forever swings between bullish and bearish extremes

A change of mood requires time; therefore, sentiment moves in dynamic cycles or waves. Therefore, the challenge is to spot and predict the extreme turning points shown in Chart 1, as observed at market tops ("Maximum Financial Risk" - Euphoria) and at markets lows ("Maximum Financial Opportunity" - Panic).

The fascinating aspects of market cyclicality is that the active investor badly underperforms across the board because he or she is prone to chasing performance near market tops and panicking near market bottoms. Identifying the behavioral patterns of investment managers, using cycle analysis techniques, can therefore provide clues to focal points of "euphoria" or "panic".

Consequently, if you have data sets that provide raw "mood" information related to financial assets on the one hand, and on the other hand have cyclic tools that can decipher and track dominant cycles, we are able to provide supporting market analysis to adjust your active investment risk.

Against this background, a cycle analysis of the NAAIM Exposure Index was performed. The NAAIM Exposure Index represents the average exposure of active investment managers to the U.S. equity markets. A value above 100 indicates leveraged long positions. The raw data of this publicly available index is not predictive in nature. However, the exposure index provides insights into the actual risk management of investment managers. In the case that cycles are found in that data set, it will allow a prediction of future exposure and risk management efforts of that group.

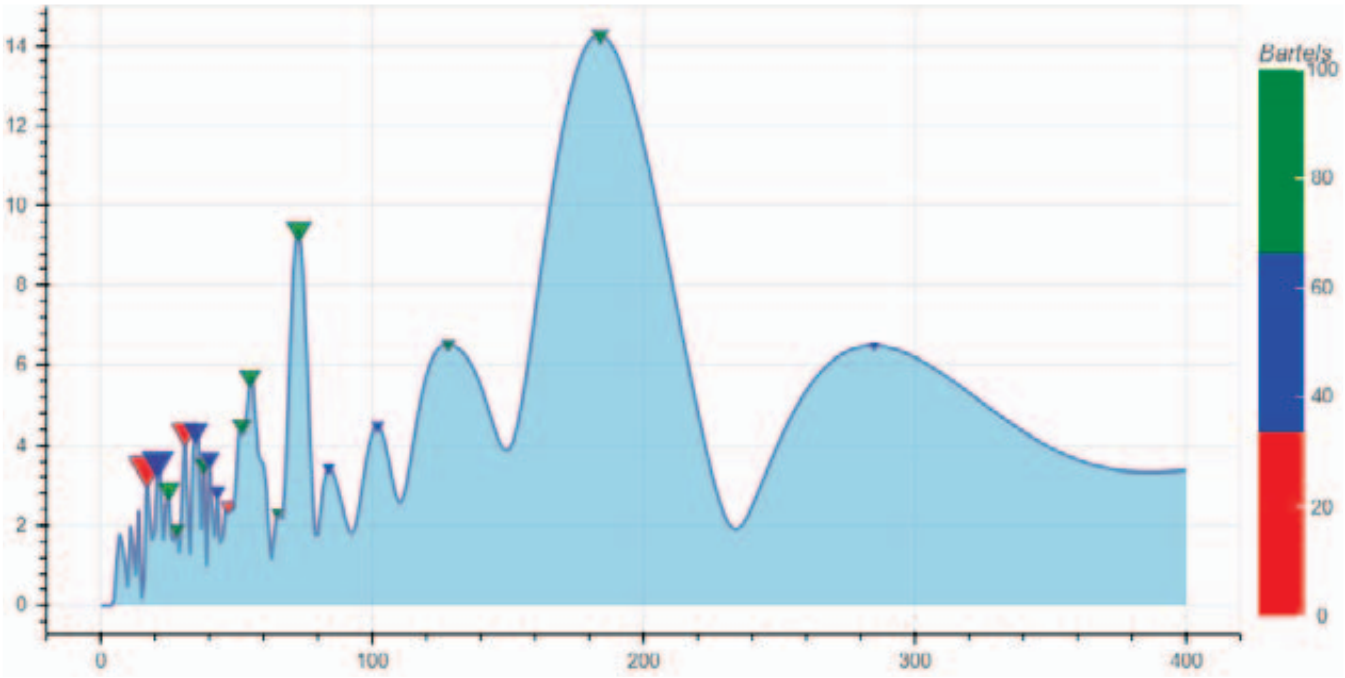

Chart 2: Spectrum analysis of the NAAIM exposure index revealed two peaks at 73 and 184 weeks

The spectrum answers the question “How much of the data is at a cycle length x?”. As we use a weekly dataseries, the peeks indicate cycles with a length of x-weeks. A cyclic data series consists of more than just one cycle. The amplitude represents the most important cycles which can bee seen on the y-axis. The colored triangles show an additional verification in regards how reliable a given cycle length is. From “red” = not trusted to green = very strong. This is called the Bartels Score which acts as second measurement in addition to the spectral analysis. The spectrum clearly shows two peaks with green triangles at 73 weeks and 184 weeks.

Once we have derived dominant cycles, we can use the information about cycle length, phase and amplitude to plot a superposition wave. Both cycles were added to a superposition wave, which simply combines both cycles in terms of their phase, amplitude, and length into one combined wave (Chart 3).

The superposition wave is the purple indicator overlay at the bottom of the chart. While the dark blue line at the bottom area is the raw NAAIM exposure index.

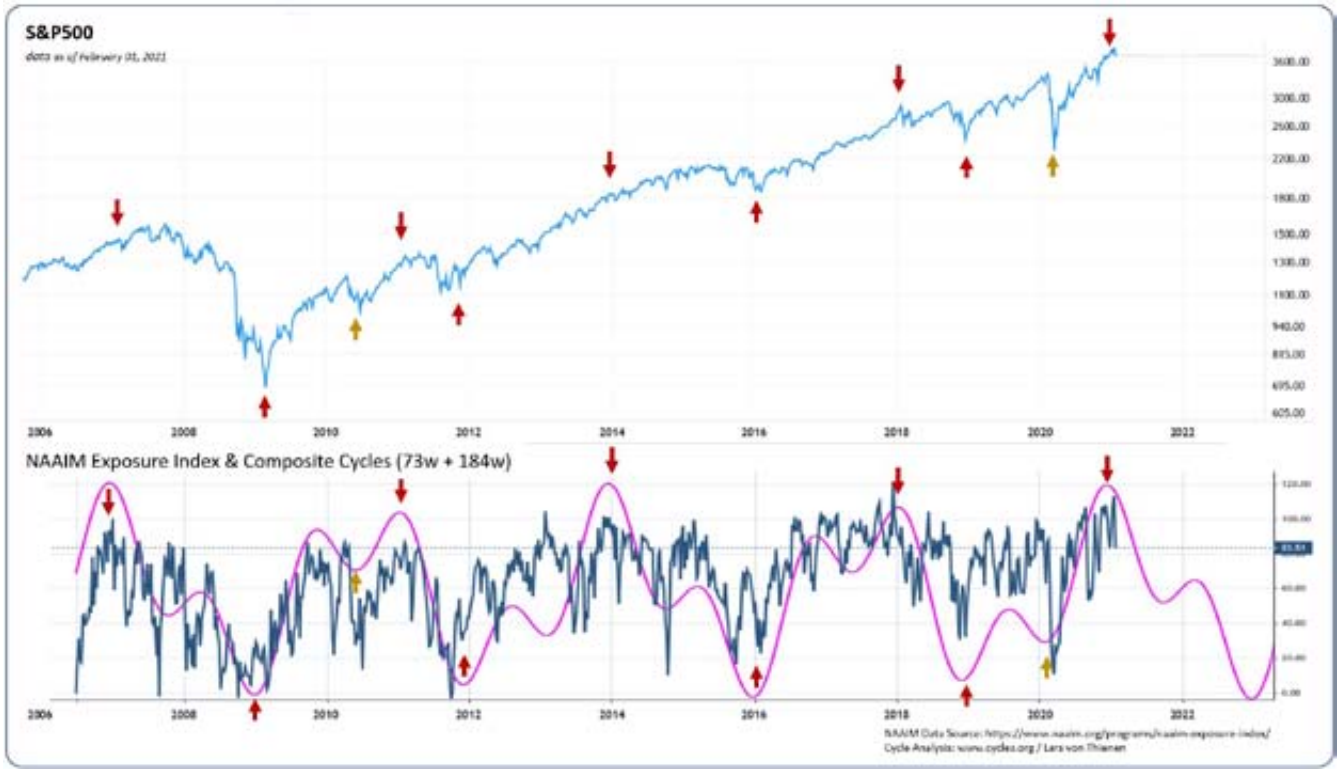

Chart 3: Superposition Composite Cycle (73w + 184w) in the NAAIM Exposure Index, S&P500 Index, Data as of Feb. 2021

Our performed cycle analysis for the entire NAAIM dataset revealed two dominant cycles combined into one superposition wave.

The composite cycle shown is significant because >90% turning points from the exposure index composite cycle correlate with important market reversals.

The composite cycle indicated:

- the 2007-2009 17-month bear market during the financial crisis,
- the 2009 market low,
- the short-lived bear market between May and October 2011, which was indicated by the high of the sentiment cycle just before Black Monday on Aug. 8, 2011, when the U.S. was downgraded,
- the 2014-2015 period began with an indicated sentiment cycle top and resulted in a sideways moving market,
- the 2016 sentiment cycle low, which indicated the start of a truly remarkable year for financial markets,
- predicting the end of the boom in early 2018, with 2018 being a worse year for financial assets. Since January 2, 2018, the S&P has fallen 8% until year end,
- pointing to the start of the next market upswing beginning in early 2019, indicated by the

low of the composite cycle. With a gain of +60% to date since the indicated December 2018 composite cycle low.

Now, at early March 2021, we have reached the next projected composite cycle high for the NAAIM Exposure Index.

Based on the dominant cycle composite analysis of investment managers exposure to the U.S. equity markets shown, the current cycle top and past correlations suggest a trend reversal in US equity markets is imminent. The shown analysis can be done with our cycle analysis toolbox provided at whentotrade right out of the box without any special settings.

Horizontal Lines Are Your Friend

By Sunny J. Harris

You have surely heard "the trend is your friend" many times over your trading life. While that may be true, markets only trend about 30% of the time and are thus in consolidation mode 70% of the time. So, the trend is your friend 30% of the time—what do you do about the other 70%? I have found, in my 40+ years of trading and investing, that two types of horizontal lines far out-perform the simple trend following adage. Long ago I started calling my lines and indicators "attractors." By choosing the word attractor, I not only include support and resistance, but the additional mean reversion indicators like moving averages and my SunnyBands and my Dynamic Moving Average (DMA). Further, I find that parallel channel lines work very well also. The trick is to blur your eyes and see "what is true." When I'm doing that, I first look at the left of the chart, not the right. I am looking for configurations that have appeared in the past and might likely influence what is going on at the right side of the chart.

Let me start with some pictures. The first figure is a chart with no attractors on it, just raw data. See Figure 1.

FIGURE 1—Continuous contract of the eMini S&P 500, no lines

Take a look at Figure 1. Take a pen or pencil and mark on the chart what you see. I call this asking "what is true?" You might mark the trends, you might mark the consolidation periods, we each see something different when we look at a chart. As for me, I look for areas where price has stalled, either on the way up or on the way down. In the next figure I'll show you the horizontal lines (attractors) I spotted. In three cases I dropped a horizontal line at a prominent peak. For the fourth line, on the far right of the chart, I dropped the line where price had made sort of a

a true attraction, where price is stalling on the way up and again on the way down. I call this situation "confluence."

FIGURE 2—Attractors at turning points and stalls in the price movement

On the next chart I'll show you one of my favorite tools, Fibonacci retracement lines. Although earlier discovered by Indian mathematicians, we attribute the Fibonacci sequence to Leonardo de Pisa aka Leonardo Bonacci and thus Fibonacci (the son of Bonacci). The well-known sequence is seeded with the values 1 and 1 and subsequent numbers are then constructed by adding together the previous two to form the next. For instance, 1 + 1 = 2 and 1 + 2 = 3 and 2 + 3 = 5, resulting in the sequence 1, 1, 2, 3, 5 … Of particular interest to traders are the ratios of adjacent numbers in the sequence. As one progresses in the sequence, the ratios converge upon 0.618 as can be seen in Table 1.

Fibonacci Number	Ratio of Adjacent Numbers
1	
1	1
2	0.5
3	0.66666667
5	0.6
8	0.625
13	0.61538462
21	0.61904762
34	0.61764706
55	0.61818182
89	0.61797753
144	0.61805556
233	0.61802575
377	0.61803714

TABLE 1: Fibonacci Sequence and Ratios

If, instead of dividing adjacent numbers, we skip one and divide the first by the third and the second by the fourth, etc, we converge on the ratio 0.382. Taken together these two values form the basis of the Fibonacci retracement and extension lines we have available in most trading software packages. In Figure 3 I've dropped the Fibonacci lines on the chart, rather than draw horizontal lines. For this example, I chose the Covid Crash of 2020 for the high and low values.

FIGURE 3—Fibonacci Retracement & Extension

Notice how often price "stumbles" when approaching and testing the Fibonacci lines. I call these lines attractors also. Price tends to make runs for the ratio levels and hesitate, pull back and then make its way on forward as it approaches each of the attractors. In my own trading I rely heavily on the Fibonacci lines, especially the 38.2% and 61.8% lines. In Figure 3 we see that price made a plateau the week of January 10, 2021 right at the 138.2% line, at a price of 3,833.40. The market neither moved up nor down that week, but stalled right at the Fibonacci line and then fell back to the 123.60% line. It's more than remarkable; it's prescient.

Another type horizontal line that is useful can be placed on an intraday chart to highlight the day's opening, high and low. I call this quite simply "Day Open-Hi-Low." The intraday low is a red line, the high is a green line and the open is a blue line. These are shown in Figure 4.

FIGURE 4—Open, High and Low Lines

Again, we see that the lines act a attractors with price touching the blue line (which denotes the day's opening price) at about 1:30am on 3/8/21, retracing back down from the line, and after making a new high it marches right back down to the blue line once again. I not only find it fascinating; I trade off of these lines real-time.

Adding another indicator to this chart, see Figure 5, makes the lines even more evident. I like to keep everything simple while I'm trading; I don't want to think about anything else but the

FIGURE 5—Day Sessions and 24-Hour Sessions Painted Different Colors

trades. So, I color the day session red and blue and the 24-hour session cyan and magenta.

This indicator is simply called "DaySessions," From Figure 5 we can see that the day session opens at 6:30am PST when the candles become red and blue, while the 24-hour session is in cyan and magenta candles.
With the chart colorized it is very apparent that the day session retraced right to the midnight opening price at the blue horizontal line. That was a 60-point short trade!

As I'm writing this article, I am trading the eMini S&P 500 and watching closely as price moves tentatively between the two horizontal lines. Notice that the range of the bars has narrowed and price is trying to find a direction.

FIGURE 6—Price Forming Between Two Horizontal Lines

Before I complete this article, price will have penetrated the lower line as traders exit their long positions before the final bell, or it will burst on out of the confinement in an attempt to position itself for another trading session. This is the beauty of horizontal lines. They highlight firm areas where when penetrated we know that price action has changed.

It is only a matter of minutes later now, and the direction of the breakout is clear. With a short entry on a stop right below the lower horizontal line, a quick $500 per contract was available in 15 minutes' time. Figure 7 shows the current chart.

FIGURE 7—Breakout of the Horizontal Line

Having said I love Fibonacci lines, let's put them on this chart and see where price is likely going. See Figure 8.

FIGURE 8—Fibonacci Retracements on the Chart

Looking at this chart in real-time, we can see that price has either dropped hastily below the 23.6% line and will pop back up to it as support, or it will continue on down to the 38.2% retracement line, which is more likely. It is 2 minutes before the close and I'm betting on traders exiting their long positions to be flat for the next day. This is earnings season and lots of news comes out after the close of the market, making for surprises both to the up- and down-side, so it's riskier to hold positions overnight.

Take a look at the chart in Figure 8 again. It is now past closing time and the market is closed for 15 minutes before the night session begins. Look where the eMini ended! Right at the 38.2% line. It didn't exactly touch it, if I drew the lines right, but it was within millimeters. This leads me to think that it will complete the move when the market opens again in 15 minutes.

I have shown you what I do with horizontal lines, of several kinds. Of course, there are more uses than just these, but you can see that horizontal lines hold much promise. By themselves, with no other indicators, you have the beginnings of a hearty trading strategy. I have horizontal lines of attraction on all my charts and look to them to illuminate future price action.
If I were only allowed one indicator or tool on my trading chart, it would definitely be Fibonacci retracements and extensions. With that I know most of what I need to know.

If you have questions or comments, or just want to talk about the markets, here is my information:

10 Core Concepts of Hurst Cycles

By David Hickson

CONCEPT #1: WHAT ARE CYCLES?

Hurst's cyclic principles have to do with cycles which affect the price movements of financial markets.

"What are cycles?" you might ask.

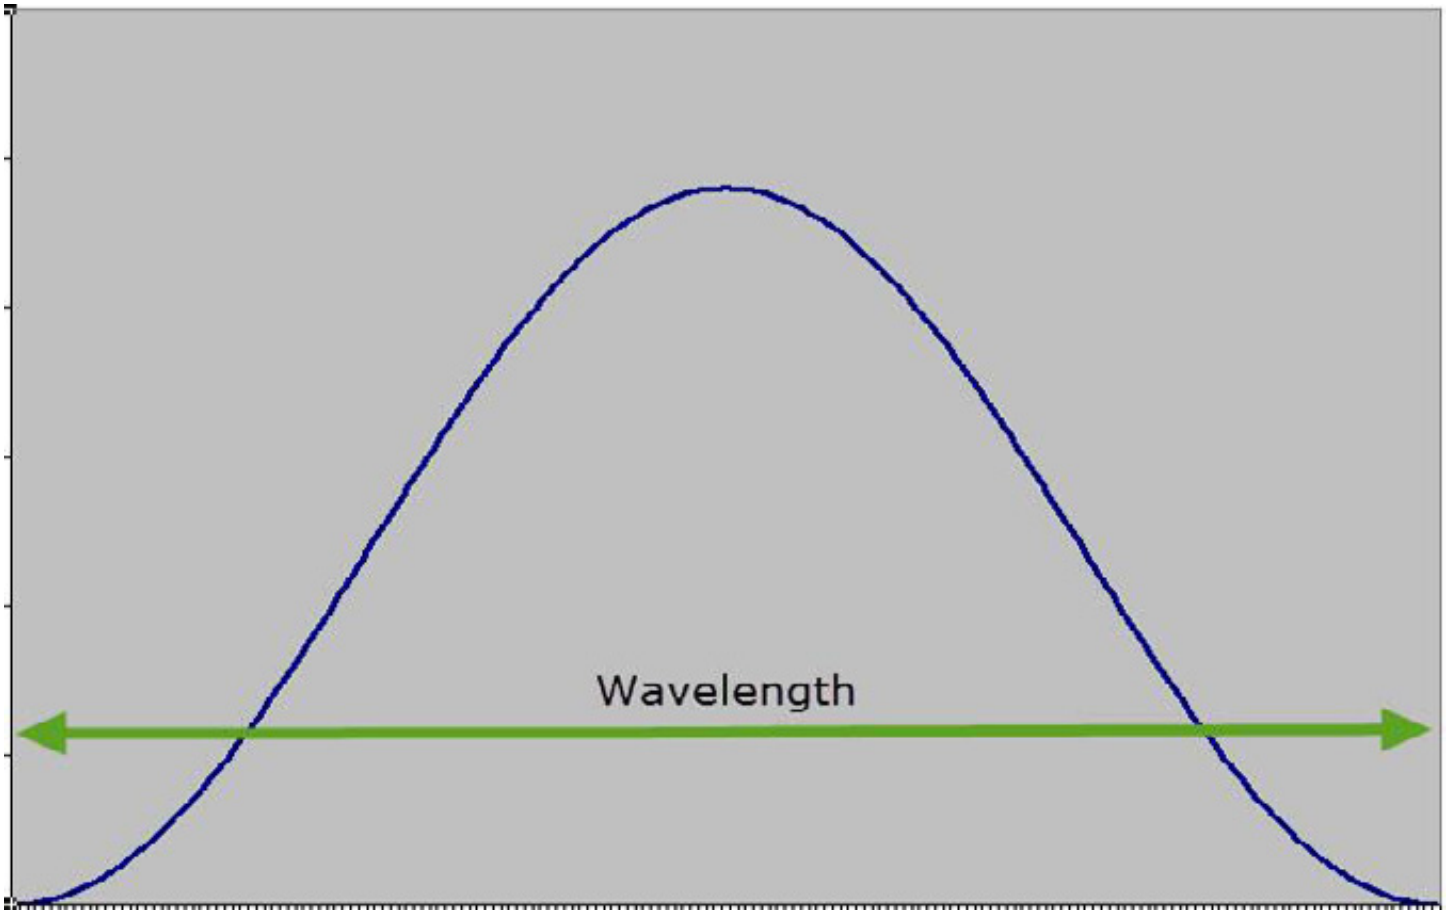

There are many different definitions for what a cycle actually is, but for the purposes of you being able to trade profitably on the basis of Hurst's cyclic principles it is ***not necessary*** that you understand what a cycle actually ***is***.

For the purposes of trading profitably, this is all you need to know about what a cycle is:

A cycle is something that influences the price movement of a financial market to move up towards a peak, and then to move down towards a trough (or low point). It repeats that action on a fairly regular basis.

The distance in ***time*** between any two troughs of the cycle is called the ***wavelength*** of the cycle.

Here is a picture of one simple cycle. It is a sine wave, which is often used as a representation of a cycle causing price to move up and then down:

An important point about this representation of a "cycle" is that the x-axis represents time, moving forward in time from left to right, which of course means that the cycle wavelength is expressed in time. And the y-axis represents the influence of the cycle on price – as it moves up it is influencing price to increase, as it moves down it is influencing price to decrease.

There is an important subtlety that you must grasp about this concept: Cycles **influence** price. What you see in the price movement (on a chart for instance) is the result of the cycle's influence. Cycles themselves work very accurately, but their influence on price is an inaccurate, rather messy process, which is why I often say that "the markets are not perfect". It is why analyzing a financial market is as much an art as it is a science.

CONCEPT #2: MULTIPLE CYCLES

Now that you know what a cycle is, the next basic concept that you must understand is that:

There are multiple cycles which influence the price movement of any financial market

In fact, there are an ***infinite*** number of cycles which influence the price movements of financial markets, but don't worry about that. You do not need to understand every single one of the infinite number of cycles! All you need to do is understand (or know) as many cycles as you possibly can.

Hurst's cyclic principles differ from many other cyclic theories, because of this simple fact: that there are multiple cycles which work simultaneously to influence the price movement of a financial market.

What is so important about the fact that there are multiple cycles that influence price movements? That is the next basic concept:

CONCEPT #3: MULTIPLE CYCLES COMBINE IN A PARTICULAR WAY

The multiple cycles that influence price movements combine in a very particular way.

We won't bother with the exact details or the mathematics here, because you don't need to understand this now, but what it is important to understand is that the cycles do combine in a particular way so as to produce this result:

- Because of the way in which cycles combine they form recognizable shapes in the price movement (see concept #8).
- The up-and-down cycle move can become very ***skew*** in the price movement. This means that price does not necessarily go up for half the cycle, and then move down for half the cycle. Price might move up for most of a cycle's wavelength, and then move down for a brief period of time, or vice versa.

Sometimes this "**skew-ness**" (or distorted nature if you prefer to stick to English) of the cycles as they appear in the price movement is so extensive that cycles seem to disappear from view altogether.

Here's an important point: ***Cycles do not disappear***. Period.

Sometimes the influence of a particular cycle is overwhelmed by another cycle which is exerting a greater influence on price. And the cycle that is being overwhelmed might ***seem*** to disappear.

But it hasn't … the cycle is still there, and it will reappear sooner or later.

Many people who do not understand Hurst's cyclic principles get stuck on this concept, and often reject the whole idea of cycles in financial markets because of this. Perhaps they have "discovered" a cycle in the market and have been trading it … and then it "disappears" along with a good deal of their trading money.

Once you understand that cycles do not disappear, and are able to apply your understanding of how multiple cycles combine to produce their effect on the price movement you will not suffer from the "disappearing" cycle (or trading money) problem.

As a matter of interest this is why software programs which extract cycle information from price movements are of little benefit to your trading. They tell you what has happened in the past, and although cycles do repeat, they are ***constantly changing*** in ways that past cycle information cannot predict (see concept #6). You might make some profitable trades, but sooner or later the cycles are going to twist, distort, or seem to disappear, and you find yourself making losing trades.

Software programs which extract cycle information from price movements are only useful for providing a ***starting point*** for a cyclic analysis. That starting point is a summary of the recent cycle wavelengths. True cycle analysis comes after that. From now on please do yourself a favor: never again make trading decisions on the basis of only a list of recent cycle wavelengths.

CONCEPT #4: CONTINUOUS TIME

Now before we go into more detail about the cycles, there is something you should understand:

The cycles that influence the price movements of financial markets exist in continuous time.

The cycles that cause financial markets to move up and down affect those financial markets twenty-four hours a day, seven days a week, three hundred and sixty-five (and a quarter) days a year *regardless of whether we are actually trading* the financial market in question.

This is another reason why software programs which extract recent cycle information from price movements can be very misleading. If a trough forms in price on a Friday, and then another trough forms on a Tuesday, the software would measure that as a two-day cycle because there were two trading days between the troughs, whereas the true measure of the cycle is in fact four days. This is only a problem for the shorter cycles, but it is something to be aware of.

Now, what else do you need to understand about the multiple cycles that influence the price movements of financial markets? How are they related? Is it just an arbitrary random collection of different cycle lengths?

No, this is the next important concept.

CONCEPT #5: THE HARMONIC NOMINAL MODEL

The cycles that influence the prices of any financial market are defined in what Hurst called the ***"Nominal model"***. Here is Hurst's default nominal model (with cycles shorter than the 5 day cycle added by me):

Name of cycle (nominal)	Average wavelength in days	Average wavelength
18 year	6547.2	17.93 years
9 year	3273.6	8.96 years
54 month	1636.8	53.77 months
18 month	545.6	17.93 months
40 week	272.8	38.97 weeks
20 week	136.4	19.48 weeks
80 day	68.2	68.2 days
40 day	34.1	34.1 days
20 day	17.0	17 days
10 day	8.5	8.5 days
5 day	4.3	4.3 days
2 day	2.2	2.2 days
1 day	1.11	26.67 hours
5 hour	0.22	5.3 hours
160 minute	0.11	160 minutes
1 hour	0.037	53.3 minutes
30 minute	0.018	26.67 minutes
15 minute	0.009	13.3 minutes
7 minute	0.0045	6.6 minutes
3 minute	0.0023	3.3 minutes

A nominal model is simply a list of cycles with harmonically related wavelengths

The left hand column in the above table is the **name** of the cycle. The longest cycle that Hurst considered it necessary to analyze is, as you can see, the eighteen year cycle.

Now, the **average wavelength in days** of that cycle, as the second column shows is 6547.2 days, and the average wavelength in terms of years is 17.93 years (the third column).

We call that cycle the eighteen year cycle because it's much easier talking about the eighteen year cycle than it is talking about the seventeen point nine-three year cycle!

In that table you see the full list of cycles that Hurst defined, cycles from a length of eighteen years down to five days. In developing Sentient Trader, I have extended the concept of the nominal model down to the intraday level, and I have been able to find and define cycles all the way down to three minutes in length.

Why do we call this an ***harmonic nominal model***? Simply because the wavelengths of each of these cycles is related by a very simple harmonic ratio.

For instance, the wavelength of the eighteen year cycle is related by a ratio of two to one to the wavelength of the nine year cycle.

CONCEPT #6: THE VARIATION OF CYCLES

Now that you understand that the multiple cycles which influence the price movements of financial markets are not arbitrary random cycles, but are a specific list of harmonically related cycles, we must move on to the next concept which is one of the fundamental principles of Hurst's cycle theory.

Cycles experience constant variation

This concept is most apparent as the constant variation in a cycle's ***wavelength***, but in fact the amplitude of all cycles varies constantly as well. Amplitude is the strength of the cycle, or how much it is pushing price up or down.

And so, although the average length of an eighteen year cycle is 17.93 years, the ***actual wavelength*** of any particular eighteen year cycle will vary from that average length, it could be longer or shorter than the average wavelength. Could be, and most probably will be!

This is another reason why knowing the recent wavelength of a cycle is not sufficient information to make a trade. Because the next iteration of that cycle is likely to be shorter or longer.

Which will it be? Shorter or longer? Read on, because that question is answered by a full understanding of these basic concepts.

CONCEPT #7: SYNCHRONIZED TROUGHS

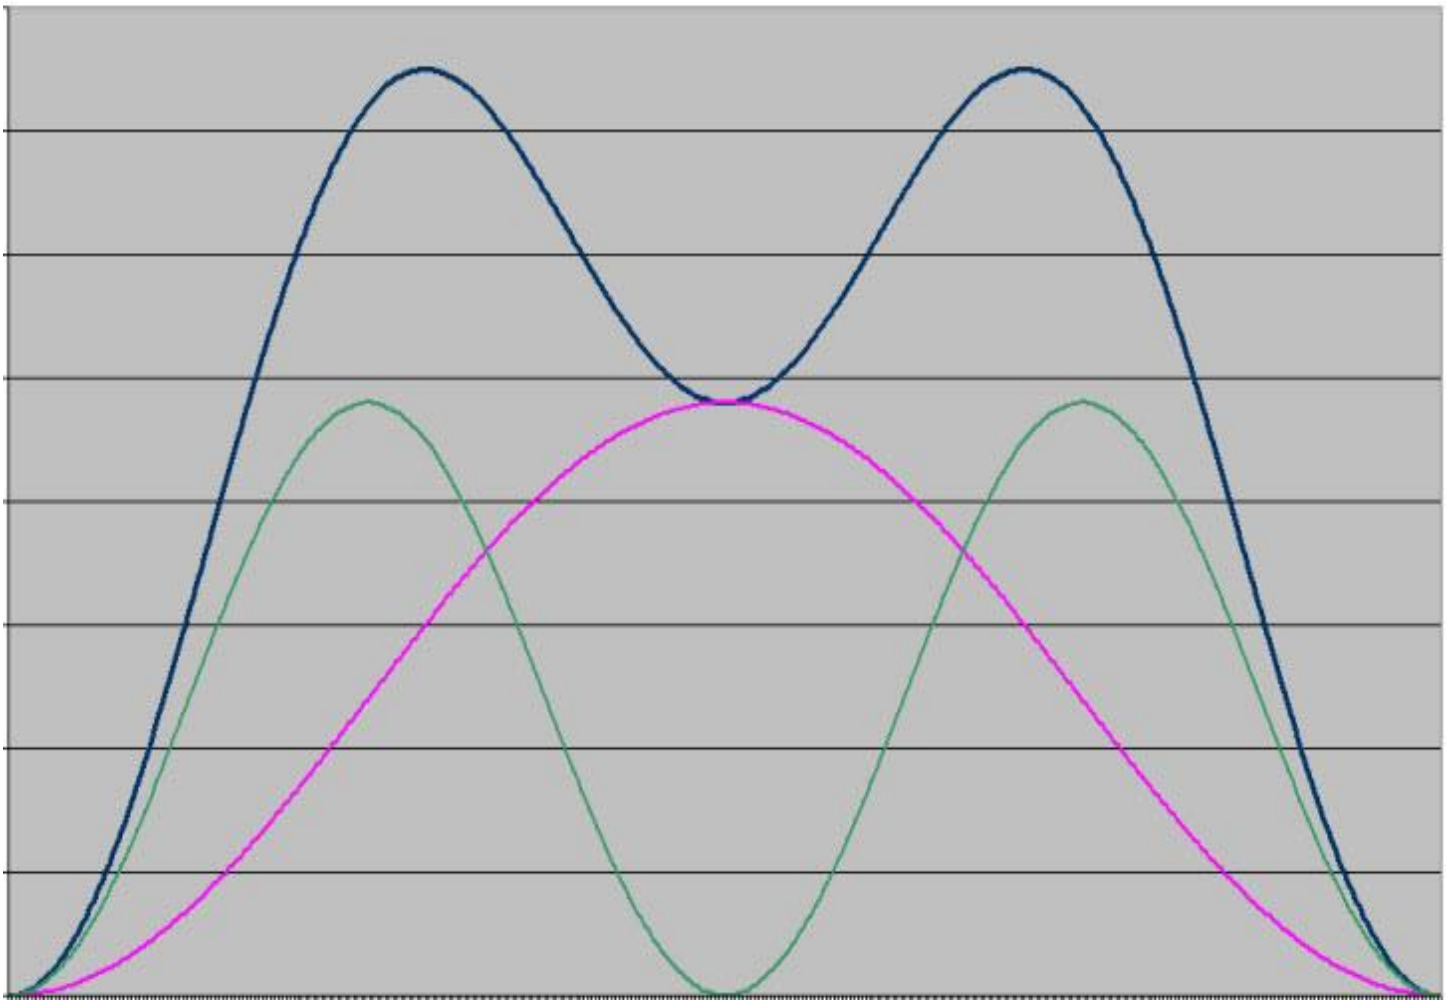

The next important concept that you must understand is that cycles which influence the price movements of financial markets, according to Hurst's cyclic principles, have synchronized troughs.

Cycles have synchronized troughs

We have already seen the list of cycles that are present in the nominal model, and which all work simultaneously to influence the price movements of a market. Now it is important to understand that those cycles have synchronized troughs.

That means that of course they do ***not*** have synchronized peaks. Here it will help in understanding this concept if we take a look at a picture. Earlier I showed you a picture of a single cycle, but now

we know there are multiple cycles that work simultaneously, and so here is a picture that shows two cycles, and the result of combining those two cycles:

One cycle is colored green, one cycle is pink. The result of combining those two cycles (and their combined effect or influence on the price movement of a market) is represented by the blue line.

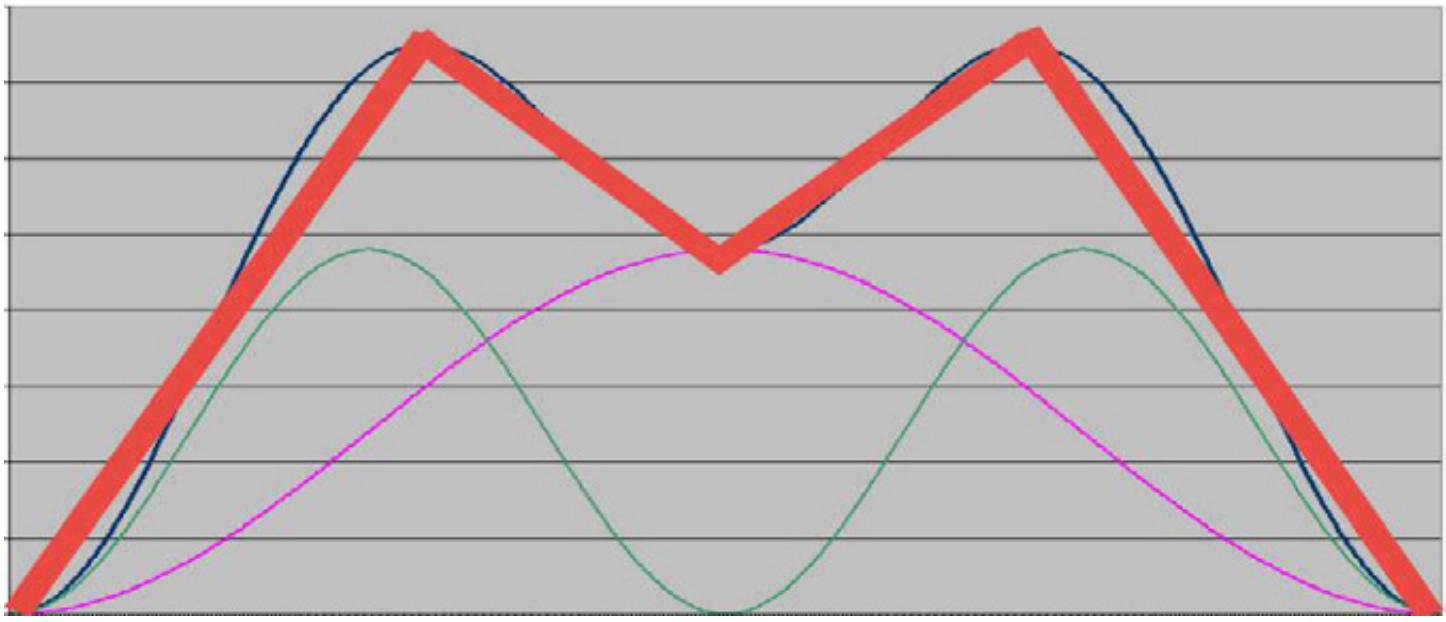

Now take a look at the peaks and the troughs of both the green and the pink cycle, and you'll see that the troughs are synchronized where possible (because they have different wavelengths it is impossible that all troughs occur at the same time), whereas the peaks are not. In other words the troughs occur at the same time, or point along the x-axis. But the peaks occur at different times.

This is a very important concept, and defines how the cycles work together to influence the price movement of a financial market. The result of the fact that there are synchronized troughs gives us a particular shape to the cycles as they manifest in the price movements of financial markets, and that is our next fundamental concept.

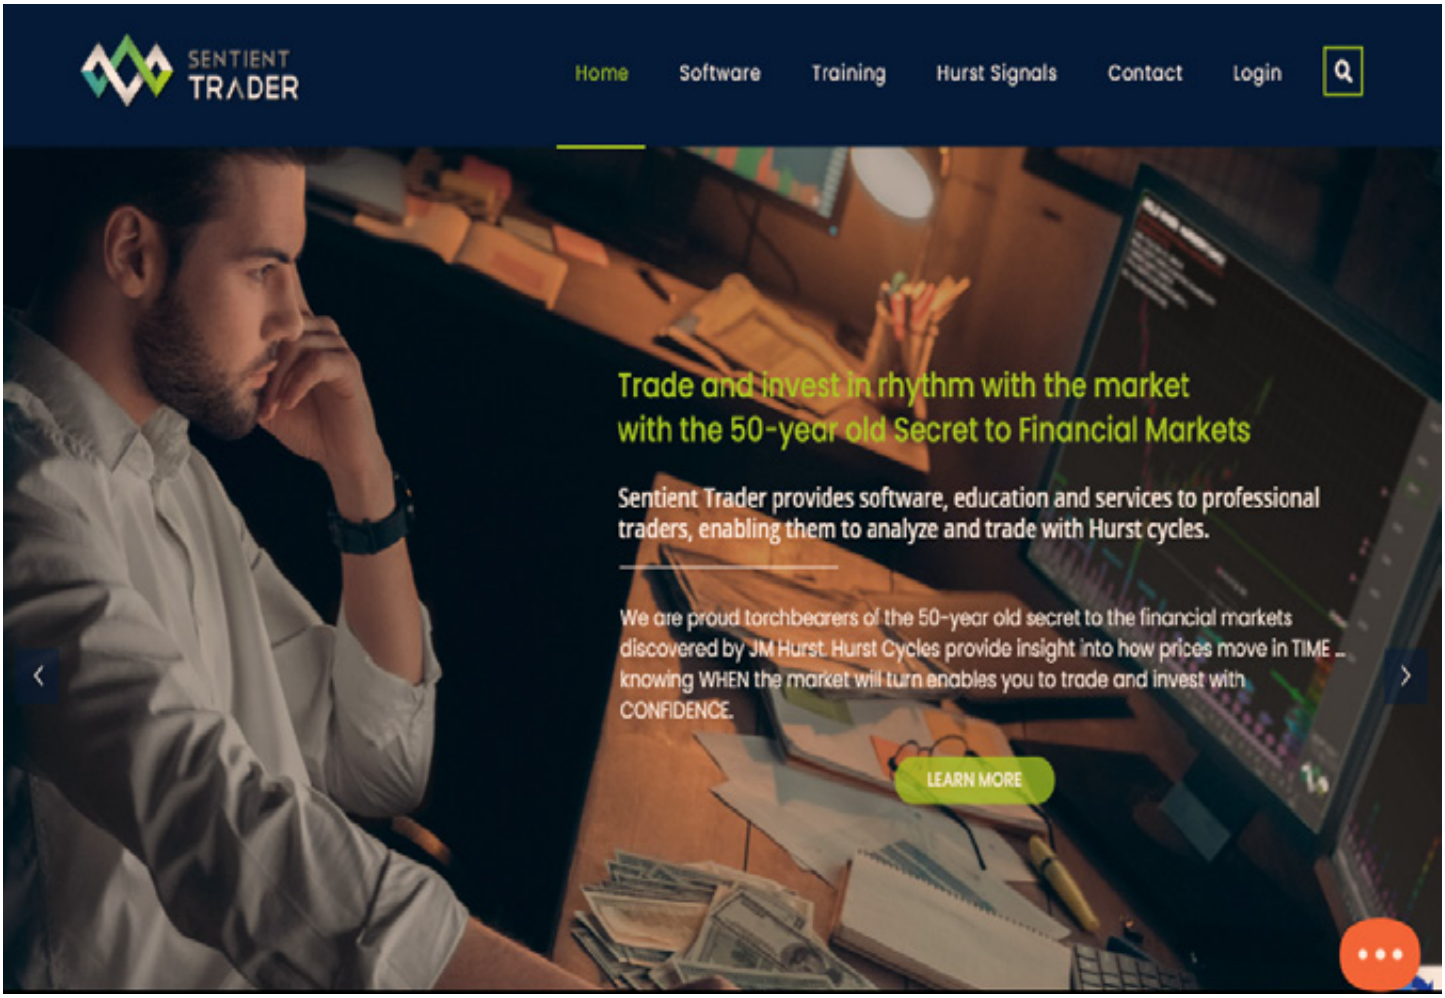

CONCEPT #8: CYCLE SHAPES

Cycles form M-shapes in price

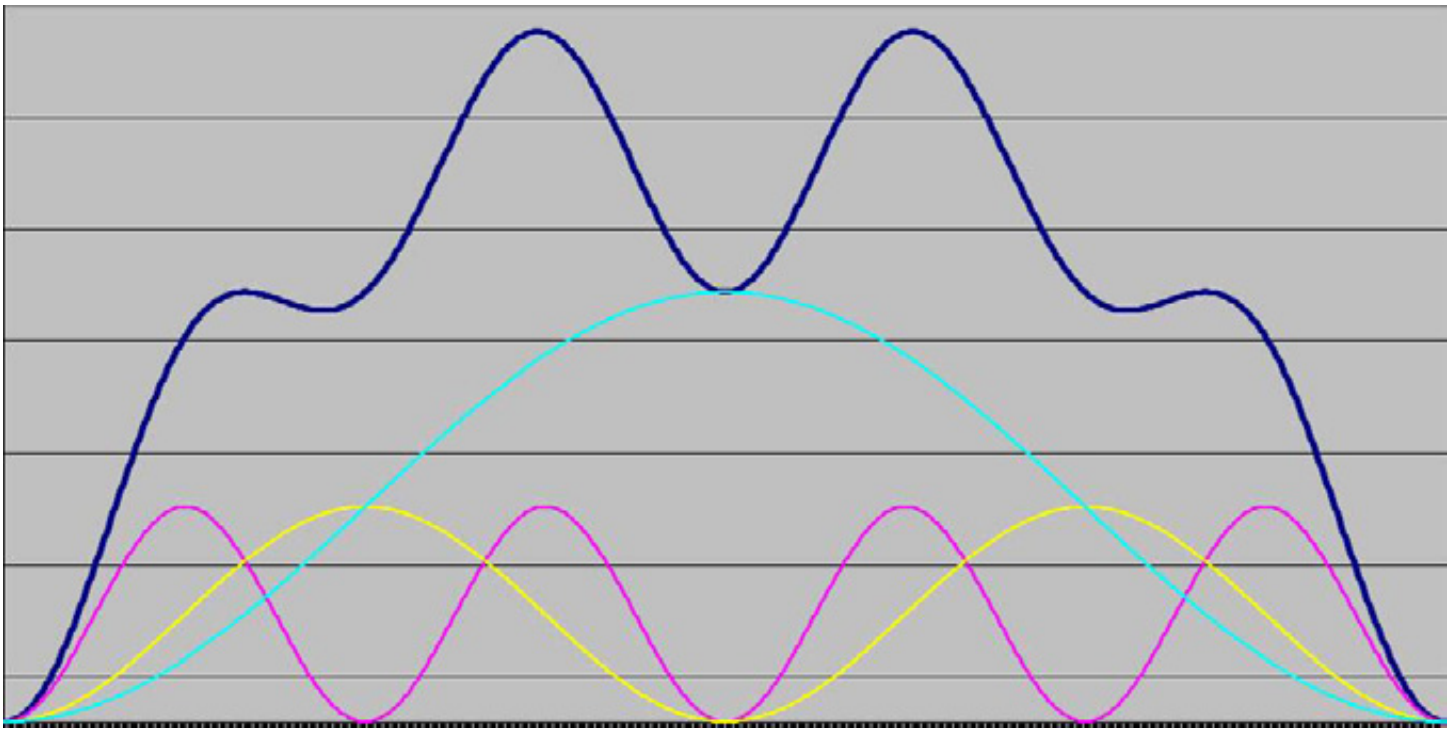

Here is that shape, highlighted in red:

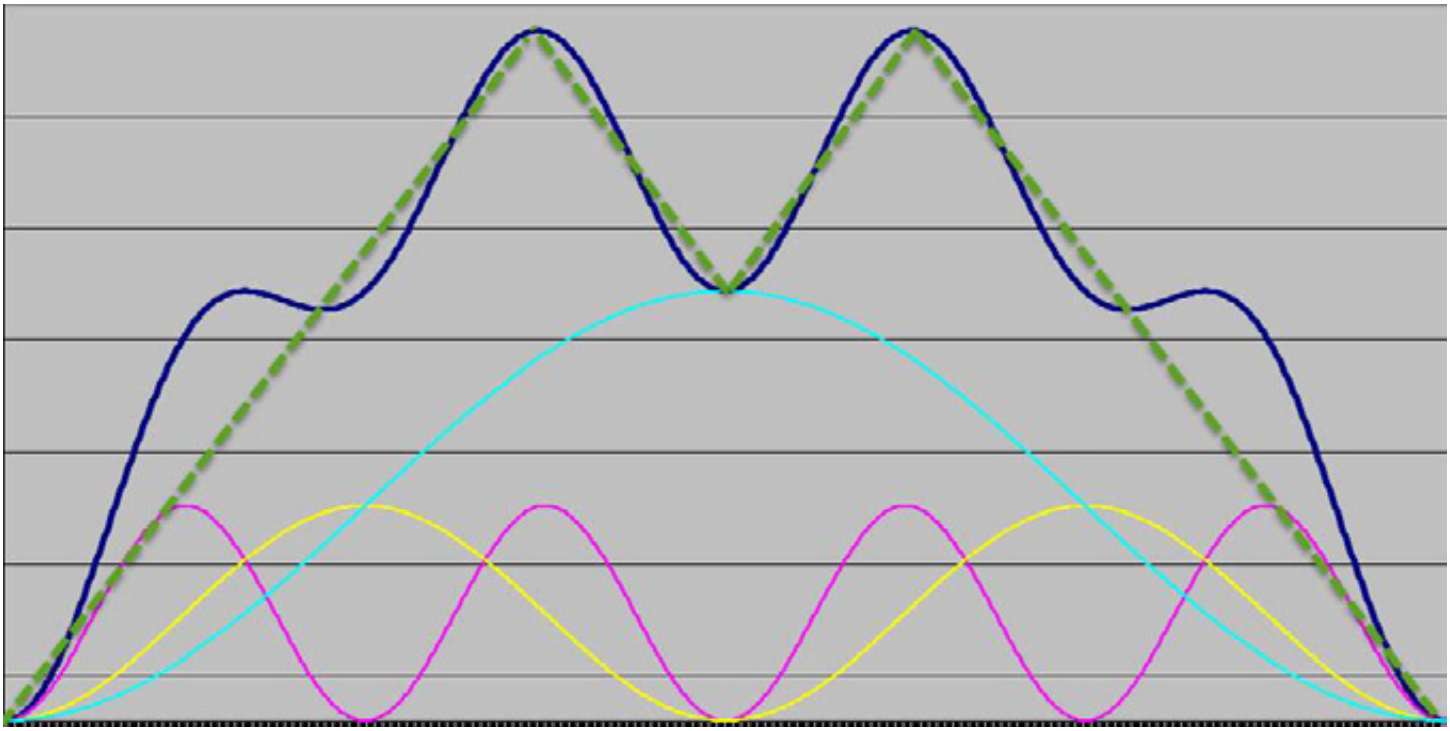

It looks a little bit like a capital M. That is the shape that results from combining harmonically related cycles with synchronized troughs.

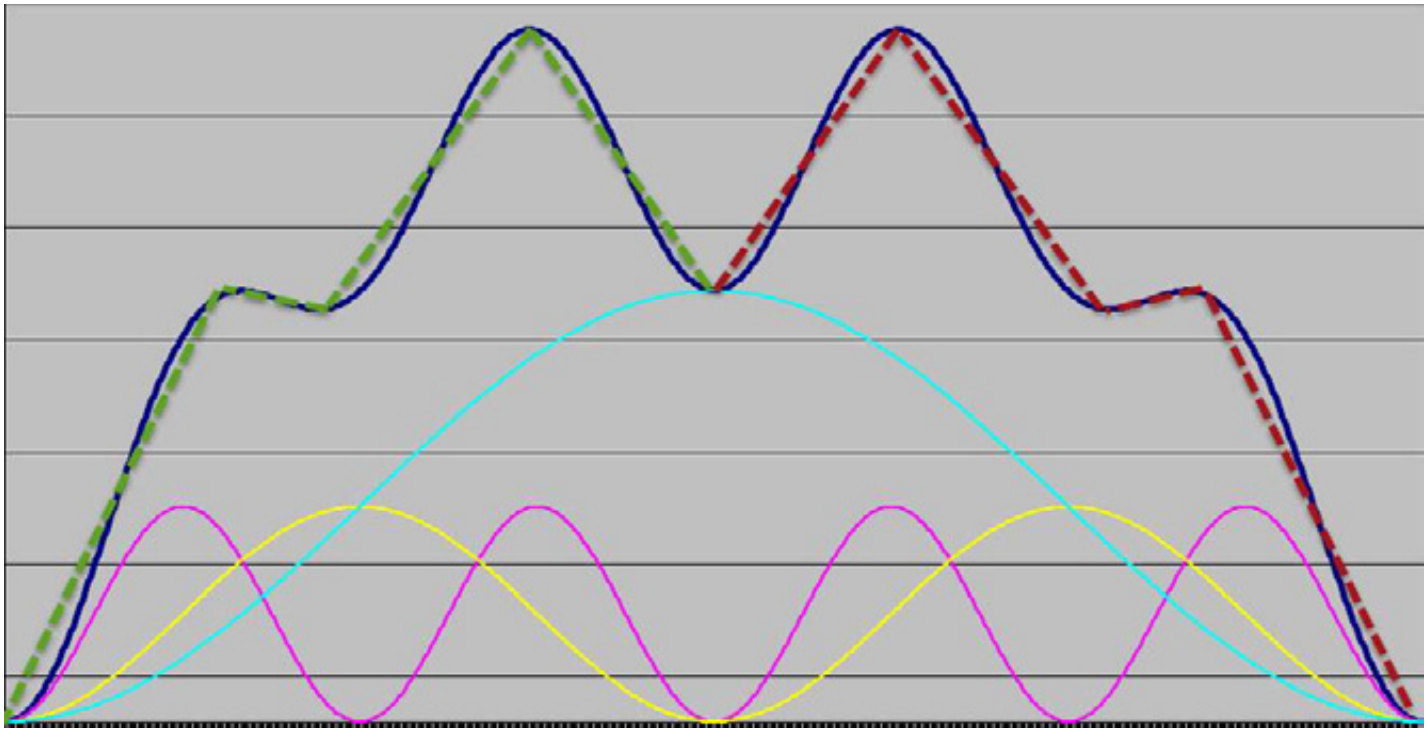

Let's take a look at combining three cycles. Here there is a pink colored, a yellow colored, and a cyan colored cycle, all of which have been combined to produce the resultant price movement which is the dark blue line at the top:

Although this shape is a little bit more complicated, you will see that it nevertheless follows the basic format of the shape of a cycle in a financial market. How many M-shapes can you see there? You probably saw this M-shape immediately:

But did you see these two M-shapes?

Now do you see what I mean by cycles being "skew" in price movement? Those are very skew M-shapes indeed, but there is good news. Cycles shapes are ***not arbitrarily skew***. There is a way of knowing what sort of cycle shape to expect, which leads us to our next fundamental concept:

CONCEPT #9: UNDERLYING TREND

We know that there are multiple cycles that influence the price movements of financial markets. However, we are going to be trading one of them. We are going to choose one of those cycles, and we are going to trade that cycle. And that cycle has something called an underlying trend.

The underlying trend of a cycle is the sum total effect of all cycles longer than the cycle that we are considering

The underlying trend of your trading cycle (or any cycle for that matter) is the combined effect of all cycles longer than your trading cycle. It is as simple as that.

What do I mean by the combined effect? I mean that for each one of the cycles longer than your trading cycle you need to answer the question: ***is this cycle causing price to move up or move down?*** That is the effect of that cycle, and the combined effect is what you get when you combine the effect of each of the cycles!

At any time some of the cycles are influencing prices to move upwards, and some of the cycles are influencing prices to move downwards and so the combined effect of the cycles changes over time.

Underlying Trend is expressed as a simple integer number. It is calculated by looking at each cycle (longer than the cycle under consideration) in turn, and adding 1 if that cycle is moving up, and subtracting 1 if that cycle is moving down.

If the underlying trend of a particular cycle at a particular time is positive then it means that the longer cycles are pushing up, and therefore we expect the cycle to be stretched (or "skewed") upwards.

On the other hand if the underlying trend of a particular cycle at a particular time is negative then it means that the longer cycles are pushing down, and therefore we expect the cycle to be stretched (or "skewed") downwards.

Wow, that is really exciting!

Do you get it? … No?

Let me explain:

1. If we perform a cycle analysis, and know what each of the cycles is doing right now …
2. We know what they will be doing in the near future (because cycles are fairly regular) …
3. And therefore we can calculate the underlying trend for the next iteration of our trading cycle …
4. And hence we can predict the shape of the next iteration of our trading cycle

And knowing the shape of the cycle means that we can trade it!

Are you beginning to see why I say that knowing only the recent wavelength of a cycle is not enough information … it is a good starting point, but that is all it is.

Now here is the final concept that you must understand. The final piece of the puzzle.

CONCEPT #10: TIME TRANSLATION

This final concept is in fact the result of the combination of several of the other concepts:

Because of the way in which multiple cycles combine, peaks and troughs in price are "time translated"

Time translated means that they are ***displaced in time***.

So what does this mean? It means that peaks and troughs in price are displaced in time from the peaks and troughs in the actual cycle.

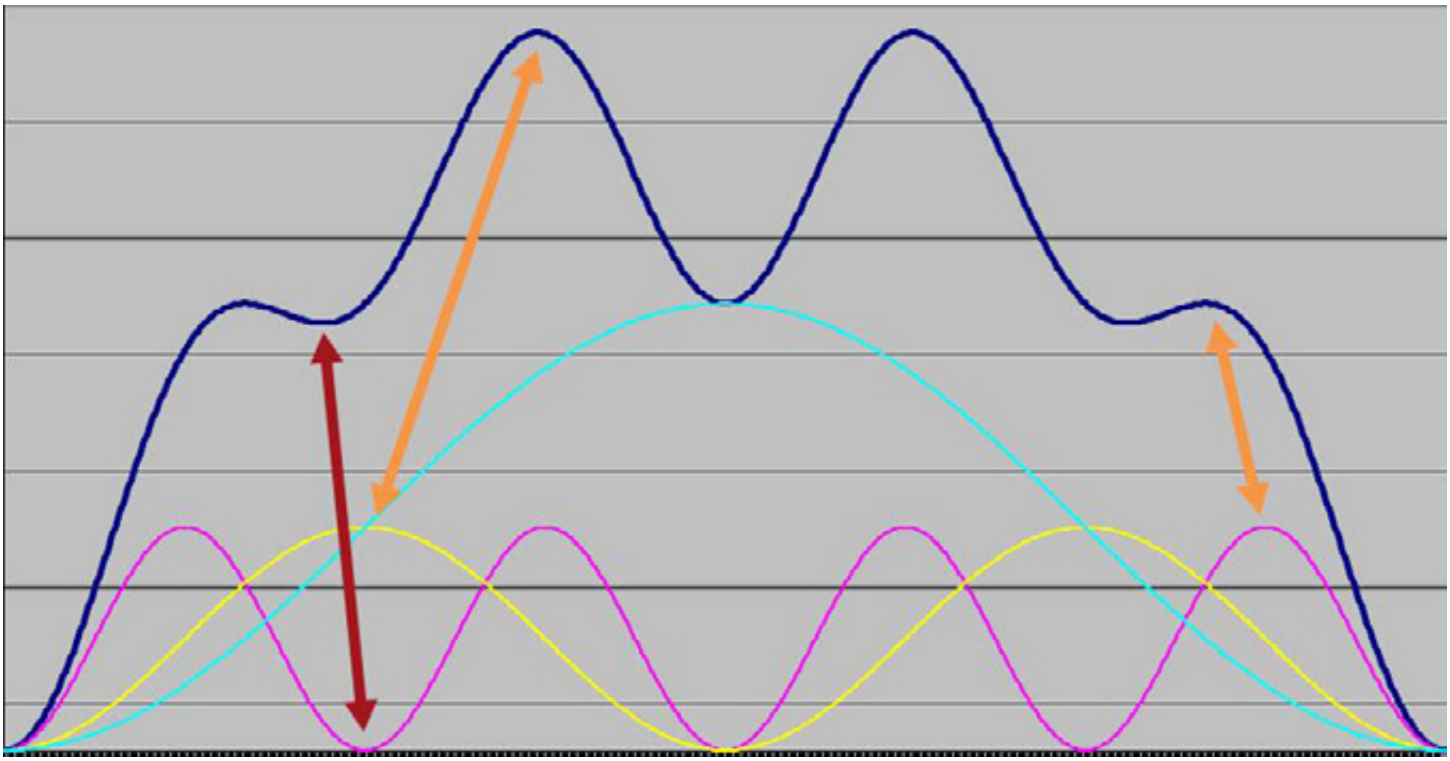

Come again? (that's an expression that means "please say that again" and it works best if you say it with a South African accent, as I do)

Peaks and Troughs in PRICE do not occur at the same time as those peaks and troughs in the actual cycles

Wait … what was a cycle again? Go back to concept #1 …

And remember that I mentioned that cycles “influence price”? We are trading the price movements, not the actual cycles … and so it is useful to know that the turning point in price might very well be displaced from the turning point in the cycle.

Here is a picture which should be familiar to you by now. Three cycles, do you see the time translation?

I have labelled with orange arrows two peaks in price which are time translated from the peaks of the cycles. If you find it confusing then look at a full cycle from trough to trough and ask yourself where the peak in the cycle is, then ask where the peak in price is over that same time period.

I have also labelled with a red arrow an example of a time translated trough. Can you see other examples of time translation in the diagram?

Where is the peak of the cyan (pale blue) colored cycle? And where is the peak in price over that time period (which is the full width of the diagram, from the cyan trough on the left to the cyan trough at the right).

Do you notice that there are in fact two equal peaks in price? Why is that? (Hint: cycles make M-shapes in price, M’s have two peaks!)

Last question, just to make sure that you are really getting this: look at the left hand yellow cycle. Can you see the two peaks of the M-shape in price? Which of those two peaks is the actual peak in price? It’s the second one … and that means that the peak of the yellow cycle has been time translated to the right in price. Translated to the right in price means that it happened later in price than it did in the actual cycle, because the x-axis represents time, moving forward from left to right.

OK so how does this help you? If the peaks and troughs don't occur at the same time as they do in the cycles then how on earth are we meant to make trading decisions? Here (finally) is the good news:

Time translation is not an arbitrary thing. We can know whether to expect a peak or trough early or late.

How do we do that? By working out underlying trend, and then:

When the underlying trend of a cycle is positive (or bullish) then PEAKS occur LATE, and TROUGHS occur EARLY

When the underlying trend of a cycle is negative (or bearish) then PEAKS occur EARLY, and TROUGHS occur LATE

OK quick test: remember that yellow cycle, which had a time translated peak in price to the right? That is a LATE peak … which should have occurred when the underlying trend is positive or bullish. Was that the case? Calculate the underlying trend for that yellow cycle now …

In case you forgot how to do that … you consider each of the longer cycles in turn. Fortunately that's fairly easy here: there is only one longer cycle – the cyan cycle. Is it going up or down for the duration of the leftmost yellow cycle? It is going UP, and so we calculate an underlying trend for the left yellow cycle as +1. That is a positive underlying trend, and so we expect a LATE PEAK, which is exactly what we got …

Is that all making sense?

By the way: this concept is the final nail in the coffin for software which only extracts recent cycle wavelengths. You must perform a full Hurst cycle analysis, and then apply this concept to help you to time your trades correctly. Never again trade purely on the basis of the recent wavelength of a cycle!

CONCLUSION

There you have it, or them: the 10 core concepts of Hurst Cycles that you need to get started.

I sincerely hope that this is the beginning of a rewarding and profitable journey for you into the wonderful world of Hurst Cycles. If you would like further information please take a look at the Sentient Trader website: https://sentienttrader.com

The 3x8 Trap Setup

By Rick Saddler

Introduction

The Markets are designed to take money out of the pockets of unprepared, amateur, or unskilled traders who do not understand the trading environment. Large institutions with professional traders operate in the markets for their benefit and because of their size, basically drive the markets. For a retail trader, the only way to be successful is to develop rules to control their emotions and give them an edge so that they can trade along side of the professional without getting wiped out.

Retail traders can achieve an edge in the market because they can, with practice, see the tracks of the large institutions in the price movement of the markets and equities. Retail traders can use this information to enter and exit the market with a much quicker response than a large firm holding huge positions. While there are many issues that a retail trader must face, they are not impossible to overcome.

The main issue facing a retail trader is to identify when an equity is under an accumulation by institutions as buyers are stepping up, or is under a liquidation, as sellers are taking charge. While it is beyond the scope of this article, every retail trader must adopt a method of understanding the market conditions and be able to identify an uptrend, consolidation or downtrend character of the markets.

As technical traders, price action is fundamental to our analysis. Using moving averages helps smooth out the price action chop and allows a trader to identify trends over time. For example, it is commonly accepted when price is above the 50 simple moving average (10 weeks of time for a daily chart) and the average is moving higher, an uptrend is in progress. When price is below the 50 simple moving average and the average is moving down, then a downtrend is in progress. Trading with the trend is the one of the best methods for following a market and equities. By using patterns or setups within a trend, we can identify quality trading opportunities.

The Setup and Examples

If you study chart patterns, you may notice that there are patterns that price action will form and repeat in a broad trend (either up or down) as an equity trades over time. By using shorter time frame averages, we can identify these patterns as they develop. The most common pattern

for any equity is that price will enter a consolidation area and then move out of that consolidation in the form of a breakout higher (or a break down lower). It is by identifying these breakout opportunities that a trader can capitalize on the movement of price as a trend progresses.

At Hit and Run Candlesticks, we use a simple setup to identify a pattern within a trend we call the "3x8 Trap". On a daily chart with candlestick bars, we add the 3 exponential moving average (EMA, pink, dash) and the 8 exponential moving average (EMA, black, solid). The trap is formed when price consolidates back towards the main trend. As the price moves, the 3 EMA will pull down toward the 8 EMA forming a trap for price. We call it a trap because price becomes "trapped" between the 3 EMA and 8 EMA as it consolidates. This pattern provides a very clear potential entry that also shows you a very clear stop area for a trader. If the price fails the 8 EMA, the pattern is broken and if a position is open, it can be closed quickly with minimal loss to the trader.

If buyers, in a bullish pattern, start accumulation of the equity again, we can see the trap trigger as price moves up and the 3 EMA moves up away from the 8 EMA.

Southwest Airlines, as an example, recently started a new upward trend out of a consolidation area. While trading out of this consolidation is possible, it is not yet a trend and if we wait, we can see that there is a 3x8 trap that forms as the uptrend develops. This is the opportunity that we look for in a bullish 3x8 trap setup – evidence of a bullish trend, a consolidation as trading institutions pause in their accumulation of the stock, a 3x8 trap forms, and a resumption of the uptrend occurs as buyers step up their activity. (See Fig 1).

Fig 1: LUV, TC200 charting software

By identifying the 3x8 Trap, a trader may use the opportunity to exploit the normal consolidation

and breakout patterns that occur in a trend. Sometimes it can happen multiple times in a short span of time within a trend. (See Fig 2).

Fig. 2 JNJ, TC200 charting software

One of the key advantages of the 3x8 trap is that there is no anticipation, no expectation, no infusions of Hopium for the retail trader. The pattern is simple and easy to identify in the stock charts in your watch list of stocks. You can "see" it coming and then set alerts for movement out of the trap and decided if the conditions and your account are ripe for a trade. In Viacom, ticker VIAC, traders in our room were able to make very good money as a 3x8 trap developed, manifested higher and then paused once again. As the chart shows, it is setting up another 3x8 trap which may trigger another move higher. (see Fig 3).

Fig 3: VIAC, TC200 charting software

The pattern also forms to the downside. In a bearish setup, there must be an overall downtrend in the equity, the 3 EMA will be below the 8 EMA. As price moves back to the 8 EMA a bearish 3x8 Trap will form. If price continues to move lower, the trap will alert to the downside. (See Fig 4).

Fig 4: AAPL, TC200 charting software

Regardless of a bullish or bearish 3x8 trap setup, the stop loss is fairly easy to determine as a movement to the opposite side of the trap is a sign of failure of the pattern. If the trap triggers in the direction of the trend, it will also be obvious as a candlestick pattern will form indicating bulls or bears are in control.

Benefits & Cautions

At Hit and Run Candlesticks, we prefer the simplicity of the 3x8 Trap as it allows us to be comfortable in our trading as we patiently stalk the setups in our watch list of stocks. When we see the setups form and alert, then we can decide if it is a good time to enter a position. There is no chasing, no urgency, no drama involved. This builds our mental equity as we gain confidence in our practice as retail traders.

When there are no setups forming or the market conditions are not conducive to trading continuation trends in equities, then we employ our SOH trading style… we sit on our hands and study charts. Or we enjoy other activities with our family and friends away from the markets. Some of our members have found relief from their self-imposed trading pressures by adopting a 3x8 Trap trading plan. This “sport” has a very long season and there is always going to be a new game tomorrow.

It must be made abundantly clear that not all setups will manifest to a positive outcome. Every technical trading setup involves some risk of loss and is never a 100% guarantee. Retail traders must discipline themselves to the understanding that we have only one proactive choice when

we decide to trade - our entry. Every decision after an entry is reactive to the conditions that develop in the market and/or equity. We need to decide what our rules are and how we will use them to protect our mental equity and financial equity. We believe the 3x8 Trap is a superior setup as part of a technical trading plan for equites in the market.

Track Record & Results

In 2018, an account was opened so that we could show this setup in real time and with 100% accountability to our members. The account was made public during the trading day and at the end of each month. The account was started with $5,000 with a goal of achieving 100% return within a twelve month period of time. Only directional options, calls and puts, would be used in the trading of only the 3x8 Trap setup.

Within a few months and relatively exciting success, the account was renamed “The Road To Wealth Account”. After 22 months of active trading, the account had risen to over $70,000 at which time it was closed out. Many members of Hit and Run Candlesticks observed this real time and some even benefited by participating in the trading room and trading their own accounts.

In August of 2020, we started another Road to Wealth with a $10,000 basis. Again the rules were the same – only directional options would be used to trade the 3x8 Trap setup, with a goal of doubling in 12 months. Currently, the account has a valuation of just under $30,000. That is a 192% gain in value in just five months! Some of our more disciplined members have reported similar, and in some cases much better results. You can follow along with the account and get links to videos at https://hitandruncandlesticks.com/trading-results-2/

DISCLAIMER: *Investing / Trading involves significant financial risk and is not suitable for everyone. No communication from us should be considered as financial or trading advice. All information provided by Hit and Run Candlesticks Inc, its affiliates, or representatives is intended for educational purposes only. You are advised to test any new approach before implementing it. Past performance does not guarantee future results.*

Conclusion

The 3x8 Trap is a simple setup that anyone can employ in their trading program as part of their trading plan. Our members have achieved great success on a daily time frame as swing traders. Longer time frames for investors and even on short intra-day time frames for day traders and scalpers. Some of our members are achieving greater than a 70% win ratio over extended periods of time. There are nuances that will improve the odds of success – identifying entry signals, setting goals for exits, placing stops – that have to be taken into consideration of any trading program. However, if you set up your charting program and start tracking stocks in your watch list, we believe you will be able to find the 3x8 Trap very quickly and easily. You may chose to add the setup to your trading program.

If learning more about the 3x8 Trap and how we use it to capture gains in the markets is of interest to you, please consider joining us at Hit and Run Candlesticks, HitandRunCandlesticks.com

Top 3 Reasons I Trade the Futures Markets and 2 Mistakes to Avoid

By Steve Wheeler

Founder and CEO of NaviTrader.com (www.navitrader.com)
Professional Trader and System Designer/Developer
www.navitrader.com

Introduction

Let me start by introducing myself. I am a full time trader, trainer and software developer in the futures markets. I run a real time Live Market Trading/Training Room two hours each trading day. I have traded for over 20 years, and concentrate primarily on the currency (FOREX), crude oil, gold and stock index futures markets, such as the S & P E-mini. In a previous career, I was a practicing C.P.A. in the state of Florida.

I have developed a full suite of charts and indicators known as the Trendicators™ and a market analyzer known as the TradeFinder™, as well as a number of automated trading systems and automated buy, sell and trade management systems.

What follows are the fundamental elements you need to be consistently profitable in the futures markets. I have also included information below that is crucial to your overall success and in managing your risk.

Preparation for trading profitably consists of market observation over a period of time so that the trader can build confidence in knowing what usually happens in the market and how to profit from the recurring market behavior that repeats itself every day. To take advantage of cycles in the markets, observe the typical move that a market moves after it moves up or down out of a range contraction pattern.

The real objective is to build knowledge of probabilities of market behavior so as to take consistent profits out of specific trading instruments. The following are observations of market behavior that will help to put the probabilities in your favor.

_____

3 Top Reasons I Trade the Futures Markets

Reason # 1: Being Able to Profit In Up and Down Markets

There are several types of futures contracts to trade within the futures markets such as:

- Stock futures
- Currency futures
- Index futures
- Commodity futures
- Interest rate futures

The beauty of futures trading is that you can just as easily take long positions on up moves and short positions on down moves.

We all know that everyone is a genius in a bull market for stocks, but we need a strategy that will work in all markets. If the futures are in a down move, you can take short positions, and in an up move you can take long positions. You are not subject to the day trading rules that exist in the stock market.

One can get short exposure on a stock by selling a futures contract and applies to all kinds of futures contracts. On the contrary, one cannot always short sell all stocks, as there are different regulations in different markets, some prohibiting short selling of stocks altogether. Short selling stocks requires a margin account with a broker and in order to sell short, you must borrow shares from your broker in order to sell what you don't already own. If a stock is hard to borrow or the fact that you cannot obtain shortable shares from your broker, you can not go short.

Reason # 2: Be Able to Take Advantage of Leverage

What trading stock futures essentially means for the investor is that they can expose themselves to a much greater value of stocks than they could when buying the original stocks. Therefore, their profits also multiply if the market moves in his direction (10 times if margin requirement is 10%).

For example, if the investor wants to invest $1250 into Apple (APPL) stock priced at $125, they can either buy 10 stocks or a future contract holding 100 Apple stocks (10% margin for 100 stocks: $1250). Now assuming a $10 increase in price of Apple, if the investor would have invested in the stock, they would earn a profit of $100, whereas if they took a position in an Apple future contract, their profit would be $1000.

Reason # 3: Futures Markets are Very Liquid

Futures contracts are traded in huge numbers every day and therefore, the futures markets are very liquid. The constant presence of buyers and sellers in the future markets ensures market orders can be placed with minimal slippage. Also, this entails that the prices do not fluctuate drastically, especially for contracts that are near maturity. Thus, a large position may also be cleared out quite easily without any adverse impact on price.

In addition to being liquid, many futures markets trade beyond traditional market hours. Extended trading in stock index futures often runs overnight, with some futures markets trading 24 hours from Sunday night to Friday afternoon.

2 Mistakes to Avoid When Trading Futures

Mistake # 1: Trading Without a System

To put the probabilities in your favor, you must have an objective method or system for your trading. Patterns repeat themselves over and over in all markets, so knowing these patterns can help to put the probabilities in your favor. The more you can automate your trading signals, the more objective you will be in your trade selection.

You need to determine a set of technical conditions for which you would take a long or short position in any market. You can use technical indicators that are widely available, or you can develop your own indicators. Once you have chosen the indicators you want to use, test them for validity in your trading. As in any testing, the more data you test, the more reliable the results will be.

Mistake # 2: Not PROPERLY Balancing Risk vs. Reward

A primary downfall of beginning traders lies in not knowing how to manage risk. The use of protective stop losses (known as stops); is one important tool in trading futures. An even more important tool is known as position sizing. Position sizing answers the question of how many contracts you should trade in the futures markets, and how many shares you should buy or short in the stock market.

We know that trading is all about how to react to your successes as well as trades that don't go your way. No discussion of trading would be complete without a discussion of risk management.

For futures trading, risk management is established with a combination of the use of 2 main components:

1. stop orders
2. position sizing

You need to pair a proven strategy along with risk management. A part of your risk management is in locking in profits and letting your winners run.

The big benefit for properly managing your risk leads to these 3 Trader Turn-arounds:

- ✓ Less Emotional Trading Stress
- ✓ Less Fear of Trading
- ✓ Less Greed in Trading

When you have too much risk at stake, you will heighten your stress levels as well as fears while trading. Also, when you do your correct position sizing, you will not let greed take over and cause you to take too big of a position which could put your entire account at risk! The outcome is usually not a good one because trading stress, fear and greed cause you to not trade your best as well as make emotional decisions.

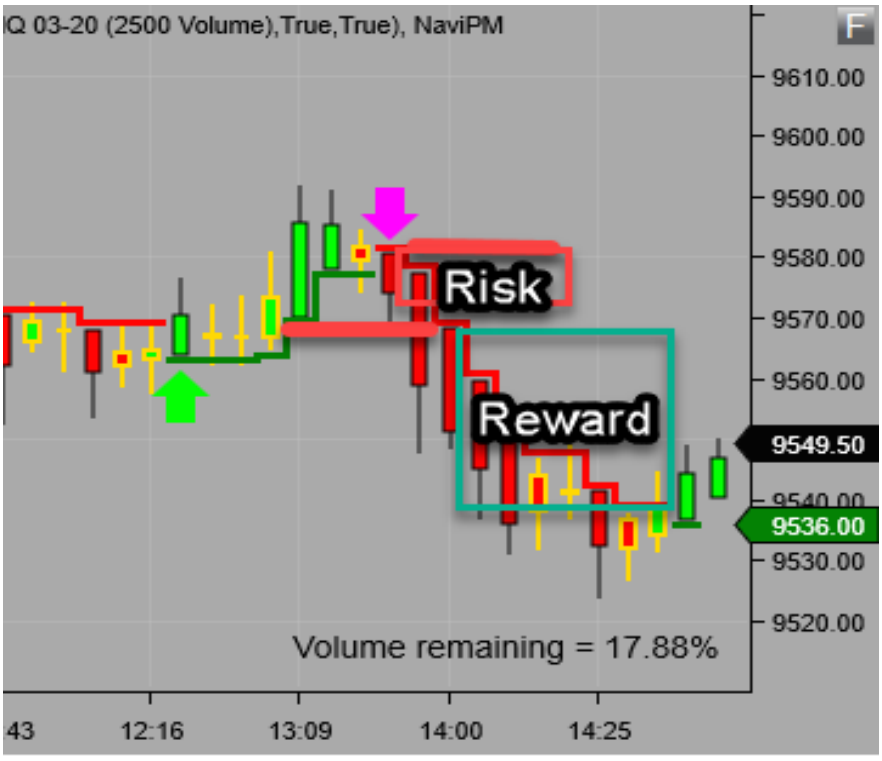

You must learn to manage stress, fear and greed to improve your trading. You can use some simple automation techniques that are programed into the trading software to help you accomplish your goals. Take a look at the following ways that you can accomplish reducing your trading fears, greed and stress.

Below you will see a NaviTrader chart with our automated trailing stop indicator (red line on a short trade and a green line on a long trade) that allows you to automate your stop management and to lock in profits, which represents a system for trade management.

Design your trades to let your winners run and to seek a ratio of risk to reward ratio of at least 1.1 to 1.5 or greater.

Below is a chart of a trade with the Risk outlined in red and the Reward outlined in green.

Risk Management Guidelines- Crucial To Your Success

The following are risk management guidelines for futures contracts. They can be used with both Mini and Micro futures contacts. Adapt these guidelines to fit your trading plan, but do heed the importance of placing daily limits on yourself in terms of loss limits. Always trade with stops in place and be sure that you properly size your positions before you enter any trade. To take the most conservative methodology, avoid trading just prior to or just after major economic news events that will impact your positions, such as Fed announcements, jobs reports, etc. These guidelines represent a conservative approach, because your main objective should be the preservation of capital, before generating profits.

One of the biggest roadblocks to trading success is risk management and properly weighing risk and reward. If you find that you are not able to achieve these objectives, you must adapt your trading plan so that you can meet these guidelines.

How the Micro Futures Could be a Game-changer for Your Trading

Some Reasons to Take a Look at Trading the Micro Futures Contracts:

- ✓ You are new to Futures trading
- ✓ You would just like to build on your strategy without taking on greater risk
- ✓ You would just like to reduce your trading anxiety
- ✓ You have a smaller trading account
- ✓ You would like to diversify without taking on too large of a risk

Many traders find they suffer from “Trading Hesitation” because of fear of losses. The Micro suite of stock index futures may be able to help you with your trading fears.

The Micros are smaller contracts sizes and therefore provide less risk per trade contract. The Micros are one-tenth the size of the traditional Futures trading contracts.

Take a look below at the differences:

Regular Futures	**S & P 500 ES**	**Nasdaq NQ**	**Russell TF**	**Dow YM**
Point Size	$50 per point	$20 per point	$50 per point	$5 per point
Micro Futures	**S & P MES**	**Nasdaq 100 MNQ**	**Russell M2K**	**Dow MYM**
Point Size	$5 per point	$2 per point	$5 per point	$0.50 per point

While the size and cost of the Micro Futures allow traders with low risk tolerance to more comfortably participate in futures, it is still wise to become educated on trading them as well as on the risk involved.

Using the Micro Futures Accounts such as MES, MNQ, MYM, and M2K to help you balance risk and reward

The micro futures have the benefit of lower risk and you will likely find them easier to trade. Below are some helpful guides for consideration to help you manage your risk.

Suggested guidelines for position sizing and loss limits:

For Each $1,000 of available margin:

- Maximum position size of 1 contract
- Maximum Daily Loss Limit of $25
- Weekly Loss Limit of $50

Risk/Reward Guides for the ES, YM, RTY, or NQ Trades

When trading the regular futures contracts, the stakes are higher, so you must carefully balance your risk and reward. Below are some helpful guides for consideration to help you manage your risk when trading the regular futures contracts.

Suggested guidelines for position sizing and loss limits:

For Each $10,000 of available margin:

- Maximum position size of 1 contract
- Maximum Daily Loss Limit of $200
- Weekly Loss Limit of $300

Example For $50,000 Account

- ✓ Maximum position size of 5 contracts
- ✓ Maximum Daily Loss Limit of $1,000
- ✓ Maximum Weekly Loss Limit of $1,500

Using Automation for Auto-Trailing Stops and AutoTrade Management can help simplify your Risk Management challenges. Anytime you simplify your trading challenges, you help make winning a greater possibility.

Below is a recording that you can watch to see how to use Risk Management processes with the Micro Futures:

Link to access the video:

https://attendee.gotowebinar.com/recording/4852146313599935235

Click on the above chart/link to watch the trade managed. If your computer has difficulty accessing the video, send an email to support@navitrader.com and we will forward the link to you in an email.

Platform

As you develop your trading skills, I suggest that you use a professional trading platform that will allow you to trade directly from the charts and will allow you to trade in simulation mode as well as to execute trades in your live futures account. As with any skill, the more that you practice, the better you get at it. It is important to develop your skills regarding the proper use of your trading platform while in simulation mode to minimize trading errors after you are trading your actual trading account.

Trading in simulation mode will help you to develop your confidence and an overall methodology that fits your personality.

Developing a Belief in Your Approach and Overcoming Fear

Most traders will develop fear as they trade due to a history of losses. Like any fear, the way to overcome it is to face fear head on, and continue to do what you fear the most. An advantage of having a trading platform that provides for simulation is that you will be able to trade in simulation mode, as in our example above to build a plan with a positive expectancy and thereby develop greater confidence in your approach to trading. As you trade in simulation mode, develop a set of notes that will act as the beginning of your trading plan. Trade in simulation mode until you have mastered the use of the trading platform you have chosen. As you trade in simulation mode, practice developing the discipline needed to execute your trading plan. Through repetition, you will begin to develop into a polished and profitable trader.

Please let us know if you need any help in developing your approach to profitable trading. Send an email to support@navitrader.com to attend our LIVE MARKET ROOM Sessions for FREE!

The information within this article as well as all charts shown are for educational purposes only and not a recommendation to buy or sell any futures contract. RISK WARNINGS: Trading stocks, options, futures and foreign exchange carries a high level of risk, and may not be suitable for all investors. Before deciding to trade, you should carefully consider your monetary objectives, level of experience, and risk tolerance. The possibility exists that you could sustain a loss of some or all of your deposited funds and therefore you should not speculate with capital that you cannot afford to lose. You should be aware of all the risks associated with trading and seek advice from an independent advisor if you have any doubts. *HYPOTHETICAL PERFORMANCE RESULTS HAVE MANY INHERENT LIMITATIONS, SOME OF WHICH ARE DESCRIBED BELOW. NO REPRESENTATION IS BEING MADE THAT ANY ACCOUNT WILL OR IS LIKELY TO ACHIEVE PROFITS OR LOSSES SIMILAR TO THOSE SHOWN. IN FACT, THERE ARE FREQUENTLY SHARP DIFFERENCES BETWEEN HYPOTHETICAL PERFORMANCE RESULTS AND THE ACTUAL RESULTS SUBSEQUENTLY ACHIEVED BY ANY PARTICULAR TRADING PROGRAM. Past returns are not indicative of future results. NaviTrader, Inc. and NaviTrader.com provide programs and services that are for educational purposes and not intended to be a recommendation to buy or sell any futures, foreign exchange, stocks, ETFs and/or options market trades. Past performance does not guarantee or imply any future success.

GANN WASN'T AN ASTROLOGER?

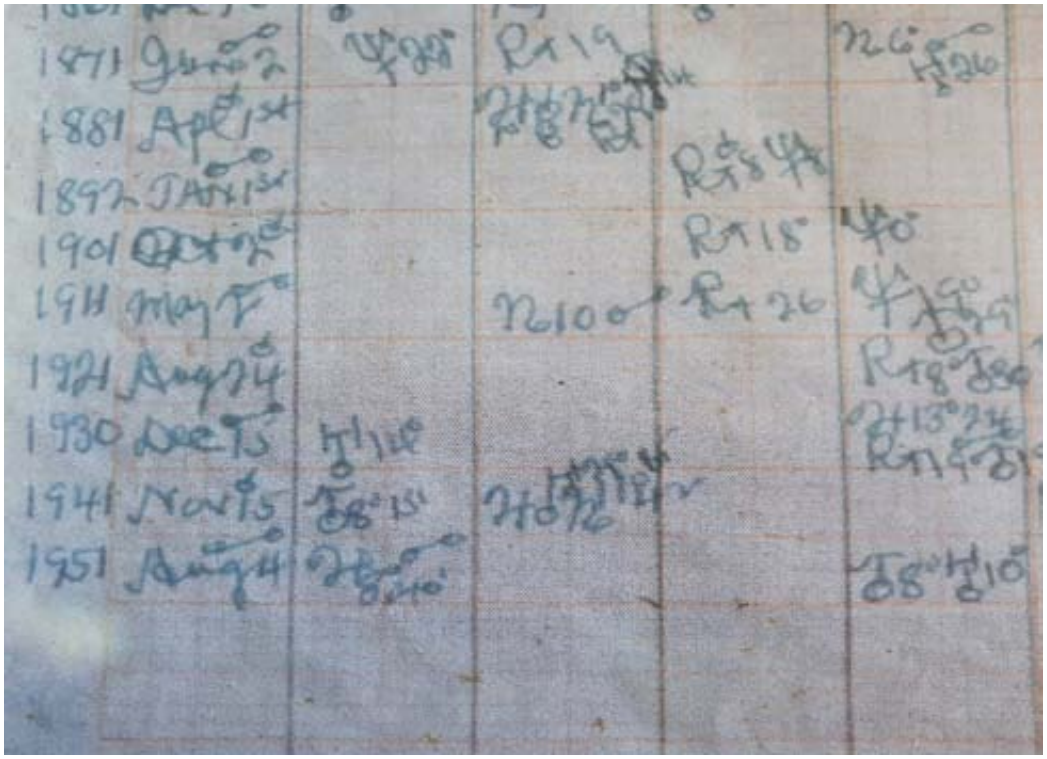

By D.K.Burton

Gann said that astrology doesn't work, without maths, ancient geometry and astronomy it's very hard to predict markets. You find that everyone doing "astrology" and doing financial markets claim Gann was doing astrology. This because it lifts their profile as they weren't heard of before but downgrades Gann's name to their levels of knowledge. It's all to sell have baked Gann methods which have nothing to do with what he was really doing.

Gann's main economic chart had all the planets of heliocentric (astronomy) from Jupiter out from when Columbus arrive in the USA in 1492, which has been shown in previous articles. Here you can see Helio written in 1924 for the Rye chart.

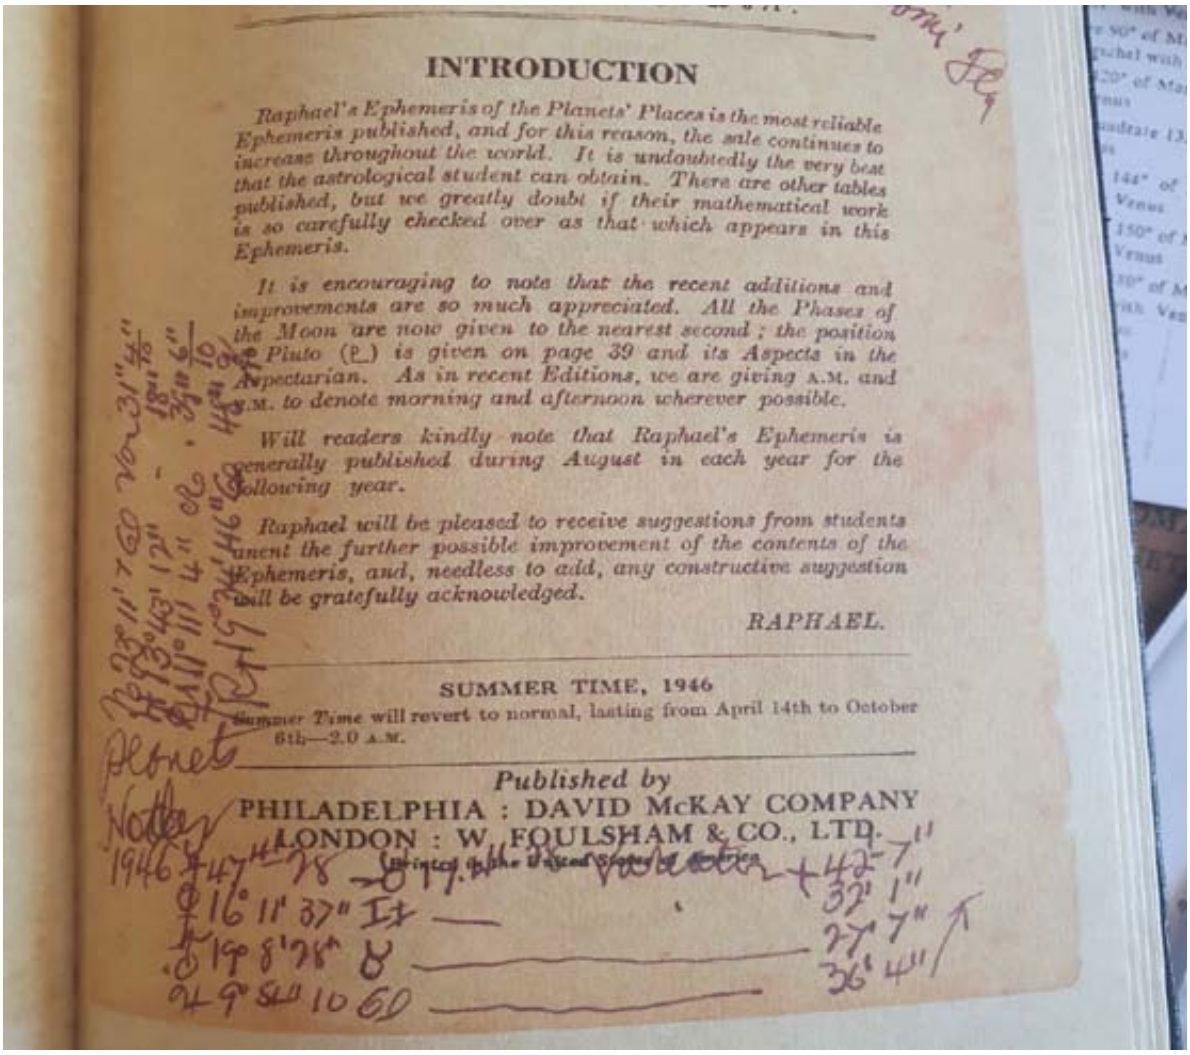

Here are all the planetary positions of his Heliocentric Jupiter/Saturn conjunctions and oppositions way back history. You can see its Heliocentric because there's no retrograde of the planets Jupiter and Saturn. The last Jupiter/Saturn opposition was on 3rd August 1951, that's what he has here for the USA.

Ganns Ephemeris from 1946 had all the planetary nodes written below. Nodes are Heliocentric. Gann said his best book was called “Popular Astronomy” By Camille Flammarion and its 600 pages long.

If someone says they are an astrologer and are a Gann expert, run the other direction. None of them have studied ancient geometry or astronomy. Gann wasn’t doing anything like these astrologers claim he was doing.

There was one Astrologer who wrote astrology and coffee course and used a chart that show heliocentric Mars on a cotton chart of Gann’s. Do your own work rather than go to a “house wife” astrologer.

INTRODUCTION

Raphael's Ephemeris of the Planets' Places is the most reliable Ephemeris published, and for this reason, the sale continues to increase throughout the world. It is undoubtedly the very best that the astrological student can obtain. There are other tables published, but we greatly doubt if their mathematical work is so carefully checked over as that which appears in this Ephemeris.

It is encouraging to note that the recent additions and improvements are so much appreciated. All the Phases of the Moon are now given to the nearest second; the position of Pluto (P) is given on page 39 and its Aspects in the Aspectarian. As in recent Editions, we are giving A.M. and P.M. to denote morning and afternoon wherever possible.

Will readers kindly note that Raphael's Ephemeris is generally published during August in each year for the following year.

Raphael will be pleased to receive suggestions from students anent the further possible improvement of the contents of the Ephemeris, and, needless to add, any constructive suggestion will be gratefully acknowledged.

RAPHAEL.

SUMMER TIME, 1946

Summer Time will revert to normal, lasting from April 14th to October 6th—2.0 A.M.

The Horn of Plenty and The Andrews Rules

By Ron Jaenisch@gmail.com

When I open my email, I often see requests from traders for the original writings of Dr. Alan Andrews. I have a massive library which can be seen at https://www.youtube.com/watch?v=MnrxXMCwhOI

I have taken the massive library and put them into three massive manuals and lots of videos to explain and update what I have. What has recently been requested is how to combine the Horn of Plenty with the Median line. This will be the subject of our live seminar in the Fall.

Below you will find a page or two of original writings of Dr. Andrews.

For those whose tuition is fully paid we show a weekly price range chart for Winnipeg Barley nearest Futures, and the 3 steps in practical analysis of such a chart to assist in realizing gains.

(1) We begin to wonder about the orderliness of price movements in stocks or in commodities, we note that whenever there is a sudden drop or rally, it is a signal that a series of 10 degree T.L.s (Trend Lines) can be generated as drawn in on this chart, each a “Horn of Plenty”.

(2) Gathering data and taking measurements on numerous active charts shows that these drawn in T.L.’s are frequently helpful in determining the pivots (buy and sell points).

(3) To find out just how orderly and useful these relationships are, we note that the rise can go on without any concern to those with a “long position”, provided the price movement stays within the first two 10 degree lines as shown.

Upon crossing the 20’ (degree) line, prices frequently drop to the 30’ line, giving opportunity to add to one’s long position, or “pyramid” for possible resumption of the rise along or within the 40’ line. Frequently, crossing the 40’ up-trend line, or UTL means beginning a substantial DTL (Down Trend Line). This is very frequently true if this downward counter move is preceded by a sharp vertical peak. The top of the price movement shown here is a rounding top, as named by Chartists.

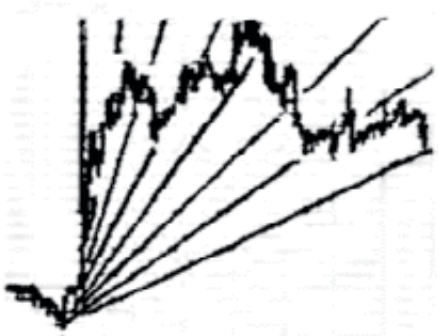

Obviously the slope of the TLs depends upon the relative proportions of the coordinates used by the maker of the chart. But by counting how frequently these pivots occur, and the exactness of fit for each particular stock or commodity charted, indicates the reliability of the probability for their reoccurrence. And action can be taken when the odds are strongly in your favor.

The words above that are underlined are all terms used in the study of Probability. Reference to the chapters dealing with Frequency, Reliability, Exactness of Fit, in Monroney's "Facts from Figures", go into their meaning and application in detail.

Upon request you will be supplied with Stephen's Stocks or Horsey's Stock Picture if you wish to apply the various aids provided by this course to particular stocks that you own or are interested in. Also you will be supplied with Dupont's Chronoflex if you wish to fasten this transparent drawing paper over your charts in order to avoid drawing-in the various lines and measurements on the charts directly.

We have also designed several devices or tools, in the use of which protection is provided through the US Patent Office, which will make it easy for you to apply the principles of probability which we have developed relative to price movements. These methods will enable you to continue to make gains similar to those made by others in this course who followed the indications properly.

Alan H. Andrews, Director

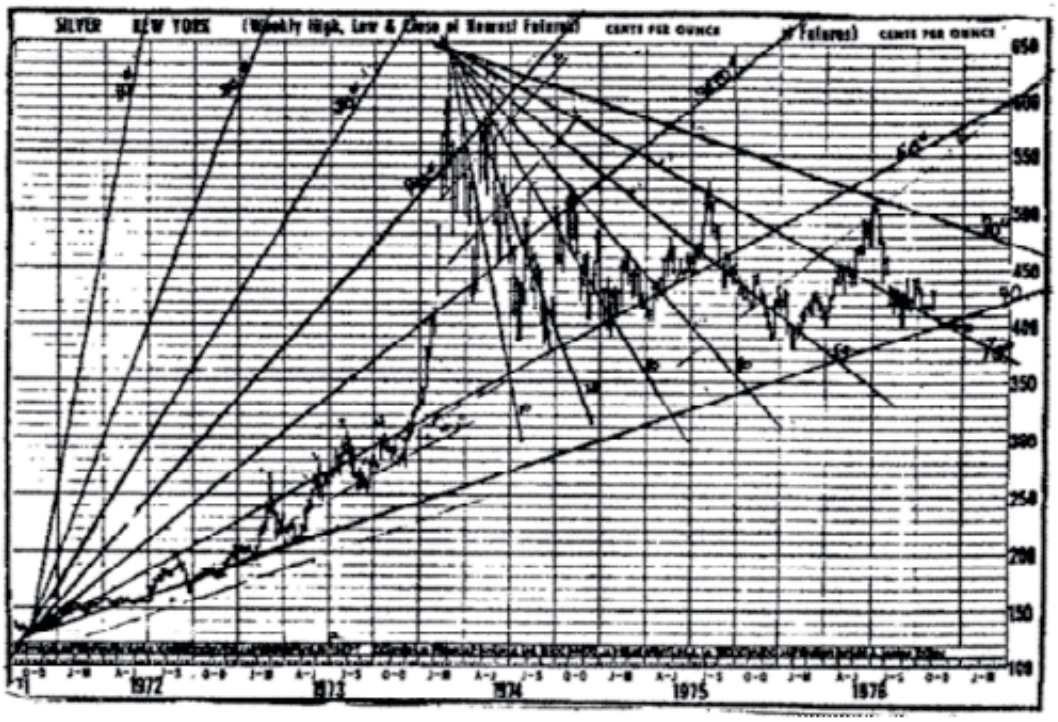

The NY Silver chart below was drawn by a new member, Mr. Edward Palm applying the Foundation's "Horn of Plenty Study". Mr. Palm has made, and is making an exhaustive Study of all available scientific Courses relative to Price Prediction, and was before going into business for himself the writer of the periodic letter sent to customers of one of the largest Commodity Firms.

The lines below from the "Horn" method illustrate how prices fluctuate along these regular geometric 10 degree radial lines as well as between them.
Another Course member has written us that he has made very satisfactory profits from the "Horn" method and it is apparently his favorite course method.

It seems natural for each person to select a method that appeals to him. One of our friends who is one of the County's largest Traders told the writer that he liked the Moving Average Channel line method for although it didn't get him in always at the bottom or out at the top, it did give him profits from the long trends. However this man was constantly on the lookout for other

successful methods. For there may be frequent times when other methods can prevent some of the "whipsaws" common to side wise movements of prices in their fluctuations.

You might like to put a piece of tracing paper over this chart and start your radial lines from the low on the last of November 1973 at the 275 area and see the similar fluctuations along and at these radial lines. Such practice certainly gives the investor a "feel" of the market.

Case study course rules

Median lines and MLH: the MLs enable the user to be one of the few who can tell where the prices are headed, and the place they will reach about 80% of the time, and when approximately that place will be reached. Slopes of alternate MLs of comparable length indicate the trend.

When both recent MLs slope in the same direction the trend is strong and price change rapid. A reverse ML is formed when 1ML2-3 is exactly reached at P4, and is a reliable CL for applying the AR method.

There is a high probability that:

1. Prices will reach the latest ML

2. Prices will either reverse on meeting the ML or gap through it

3. When prices pass through the ML, they will pull back to it

4. When prices reverse before reaching the ML, leaving a "space", they will move more in the opposite direction than when prices were rising toward the ML.

5. Prices reverse at any ML or extension of a prior ML.

Frequently, after crossing a lower MLH, prices continue to rise along the MLH before the further drop that was signaled by passing through. So here you can use a sliding parallel through the bottom of the range of the most recent day as a sell signal if prices drop through that SH.
MLH are places beyond which each day you place a buy or sell order before the market opens the next day if prices pass through that MLH. MLs between P2 and P3 can start from nearby or more remote P1s, and prices tend to reverse at each of these MLs. The distance of each MLH from its ML is the distance of the next warning line (WL) from that MLH. When a second "space" reversal negates a previous one, there has been a "shake out" that signals a larger move in the opposite direction.

Mini median lines (MMLH): Use the MMLH as the buy/signal when you expect a reversal because of a P5, or because prices are at an RL, WL, major ML extension, etc. Also use MMLH as a stop loss right after entry.

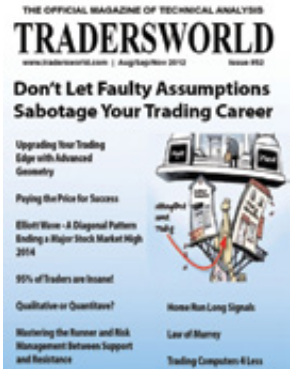

If prices cross an MMLH and then move along it, enter when prices reverse by use of an SH. In some markets drawing MMLH from end of ranges is best to reduce whip-saws, but use closes to draw these MMLHs between usually.

Converging lines that meet prices have high probability of trend reversal. MMLH lines can be drawn through the daily range after a gap.

Two to four days is usually a maximum between 2 and 3 for an MML. P1 can be 1 day or more back from 2 and 3.

HYPOTHETICAL PERFORMANCE DISCLAIMER: HYPOTHETICAL PERFORMANCE RESULTS HAVE MANY INHERENT LIMITATIONS, SOME OF WHICH ARE DESCRIBED BELOW. NO REPRESENTATION IS BEING MADE THAT ANY ACCOUNT WILL OR IS LIKELY TO ACHIEVE PROFITS OR LOSSES SIMILAR TO THOSE SHOWN; IN FACT, THERE ARE FREQUENTLY SHARP DIFFERENCES BETWEEN HYPOTHETICAL PERFORMANCE RESULTS AND THE ACTUAL RESULTS SUBSEQUENTLY ACHIEVED BY ANY PARTICULAR TRADING PROGRAM. ONE OF THE LIMITATIONS OF HYPOTHETICAL PERFORMANCE RESULTS IS THAT THEY ARE GENERALLY PREPARED WITH THE BENEFIT OF HINDSIGHT. IN ADDITION, HYPOTHETICAL TRADING DOES NOT INVOLVE FINANCIAL RISK, AND NO HYPOTHETICAL TRADING RECORD CAN COMPLETELY ACCOUNT FOR THE IMPACT OF FINANCIAL RISK OF ACTUAL TRADING. FOR EXAMPLE, THE ABILITY TO WITHSTAND LOSSES OR TO ADHERE TO A PARTICULAR TRADING PROGRAM IN SPITE OF TRADING LOSSES ARE MATERIAL POINTS WHICH CAN ALSO ADVERSELY AFFECT ACTUAL TRADING RESULTS. THERE ARE NUMEROUS OTHER FACTORS RELATED TO THE MARKETS IN GENERAL OR TO THE IMPLEMENTATION OF ANY SPECIFIC TRADING PROGRAM WHICH CANNOT BE FULLY ACCOUNTED FOR IN THE PREPARATION OF HYPOTHETICAL PERFORMANCE RESULTS AND ALL WHICH CAN ADVERSELY AFFECT TRADING RESULTS.

VECTOR TRADERS CONSORTIUM
PROFESSIONAL TRADER TRAINING

S&P 500 E-Mini Futures Professional Trading Course

TESTIMONIALS

"I recently spent 8 hours training one on one with Jeff Kilian. He is by far one of the top Technical Analysts in the world today and clearly showed me how a trader or investor must first become an Expert Market Timer in order to profitably trade stocks, ETF's, mirror funds or futures in real time. Superior analytical and communicative skills combined with being a real-life professional trader, set him apart from all others. It was a real pleasure to work with him." I recommend this course to traders of all levels.
Larry Jacobs - Trading Champion and Editor of Traders World

"I was in every Module of this course as Jeff Kilian administered it in real time. I was completely blown away at just how much usable material I got out of this Trading Course. Now I know what top professionals are looking at when they trade."

Allan Saito – 5 year Full time Professional Trader

"Who could have ever believed that I would finally get the right information and become a real money making trader."

Pierce Forsythe Independent Trader

"This Trading Course is so much more than anyone could realize. It must be taken to be believed. A month after I finished it, I moved right into the Executive Mentorship Program."

Diane Harbel Independent Trader

"What I was given was a complete encyclopedia on proper trade selection, and how to mitigate open risk"

Elizabeth Dominguez Independent Trader

MODULES 1 & 2

Module 1: Critical Nature of Volume

Module 2: The Core Indicators

MODULES 3 & 4

Module 3: Advanced Trend Line Applications

Module 4: Fading the Largest Institutions

MODULES 5 & 6

Module 5: Divergence Analysis / Results

Module 6: Objective Analysis / Results

MODULES 7 & 8

Module 7: Real Time Trading Demystified

Module 8: Fibonacci Ratios for Professionals

Bonus Curriculum Material: Target and focus will be on the correct application of Fibonacci ratios to identify valid support resistance levels, and lay out clear price profit targets in advance.

How We Deliver Your Course to You: All course material has been uploaded to the Citrix GoTo Webinar Global Servers, and is available for you to view on demand 24 hours a day, 7 days a week for life. Upon payment you will receive an email confirmation with links to all modules in this course.

Simplifying Market Analysis with GoNoGo Charts®

ABSTRACT: Price, volume, and many market statistics help investors understand the macroeconomic environment, fund flows, investor sentiment, and many other aspects of the backdrop against which we must make trading decisions. The literature tells us that humans have evolved a heightened sense of pattern recognition and visual comprehension to distinguish predators from prey. Naturally, innumerable tools and indicators have been developed over the past 50 years by expert technicians and market analysts to help investors understand complex information generated by the markets through data visualization – "Charts". In our data-driven world, it has become increasingly difficult to separate signal from noise, to find insight in ever-expanding reams of information, and therefore derivative price-based indicators have proliferated. Unfortunately, the more information represented on a chart, the harder it is for the human eye to reach conclusions… until now. GoNoGo Charts® were designed to leverage investors innate visual processing power to deliver comprehensive market information in an elegantly simple tool.

INTRODUCTION: TREND-FOLLOWING INVESTMENT STRATEGIES

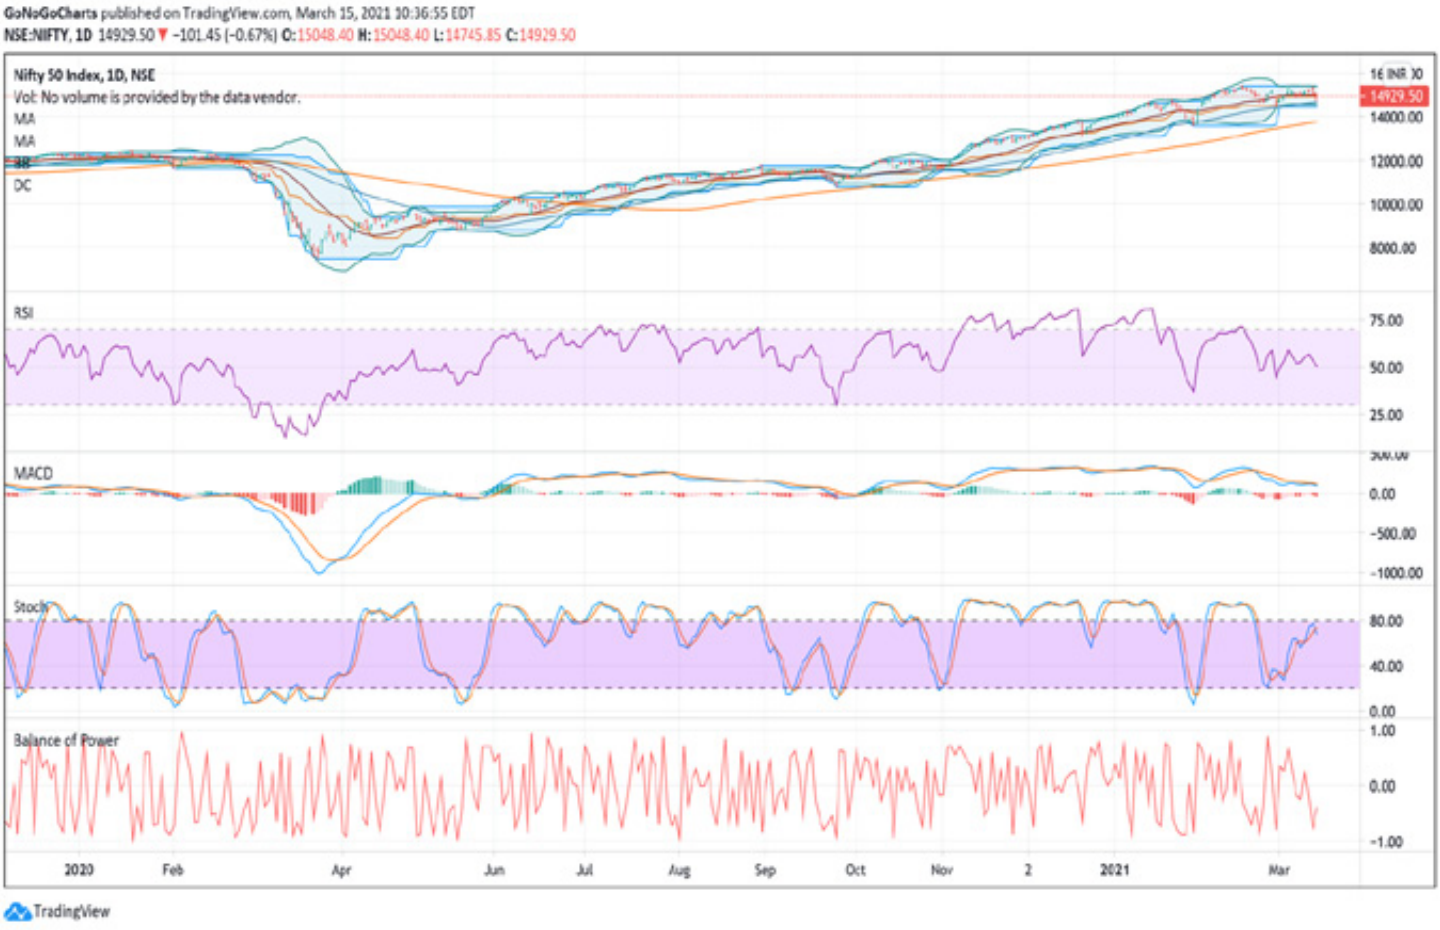

The goal of long-only investors is to participate in uptrends, selling securities at higher prices than where they were purchased. For value investors, the aim is to find securities reaching absolute lows relative to an estimate of intrinsic value. For growth investors, the objective is to buy securities already making new highs with the expectation that trends will carry them much higher. Yet, to be successful with any style of investing, it is critical to know when the trade has ended.

Investors and analysts develop checklists or rules that, when broken, dictate their sell discipline. Has price crossed below a moving average, broken a trendline, or broken below a key support level? Are oscillators or momentum indicators diverging from price? Has volume changed dramatically? It is these critical checklists that help disciplined investors cut losses short and let winners run. However, disciplined investing can lead to unruly charts.

GONOGO CHARTS BLEND TRADITIONAL TECHNIQUES

The genesis for GoNoGo Charts was to simplify overly complicated technical analysis – a complaint of many critics and users alike. How can an investor review all the necessary data in a single view of a security or index? As more indicators and tools are added, price becomes obscured. Price is the most important indicator of all market analysis, so it is at best counterproductive to obstruct price action under multiple derivative indicators. At worst, analysts miss the most important facet of understanding a security's risk/reward conditions.

Consider the example price chart below. Although an experienced technician may be able to read and interpret all these lines and extra panels, it restricts their ability to perform traditional price-based analysis. For example, trendline annotation, identifying key areas of support and resistance, or classical pattern recognition would be hard to perform on a chart such as this:

To solve this problem, GoNoGo Charts combine the most widely used and heavily tested technical tools and concepts into one easy-to-read chart that keeps the focus on price, emphasizing the direction, trend, and momentum using colors. This allows analysts to annotate the chart as they would a naked line,

candle, or bar chart, with the added insight of integrated indicators represented by the gradation of color and explicit flags at reversal points. Consider the chart below:

There is more information embedded in this chart than in the overloaded chart we looked at above.

In the main panel, price action is unobscured. The five colors of GoNoGo Charts are easy to interpret and accurately represent the comprehensive technical conditions of a security's *trend*. GoNoGo Charts paint price bars bright blue when its unique mix of inputs signals the strongest bullish environment. When slightly less bullish, the color turns to aqua. This can happen at the start of a new trend, or after bright blue bars, indicating that the trend may be weakening. The amber bars represent uncertainty, often appearing in the transition from bull trend to bear trend and vice versa. The lower intensity bearish color is pink, and the darker purple appears when the bearish trend intensifies. Annotating the GoNoGo Trend chart with retracement/extensions, trendlines, identifying areas of support/resistance, or recognizing other price patterns is now much easier as multiple indicators are blended directly into the price chart.

The lower panel depicts the GoNoGo Oscillator® which is similar to GoNoGo Trend in that it blends several of the most revered momentum concepts, as well as volume into one easy to read indicator that

shows a security's momentum as it moves between extremes of overbought and oversold. These extremes correlate with the peaks and troughs in price explicitly (two peaks have been highlighted above by white arrows on the lower panel but are automatically identified with counter trend correction icons in the price chart. They are the red triangles above price peaks).

Another powerful technical concept commonly used when analyzing momentum on a price chart is spotting divergence from price as a potential leading indicator of trend reversals. Examples of this concept are shown with the dashed trend lines in the upper and lower panels. In the Dec/Jan period, price reaches a new high in a strong uptrend (blue and aqua bars painting higher highs/lows). However, GoNoGo Oscillator fails to confirm the new high in momentum (lower highs in the oscillator panel). In the second period Feb/Mar, price is in a downtrend ("NoGo" flag followed by pink and purple bars painting lower highs/lows). The dashed line highlights that momentum is rising (higher lows in the oscillator panel).

This momentum divergence from price is an early warning to investors whichever side of the trade they are on. In the first example, what follows the divergence is a break below zero in the lower panel (negative momentum) and color change of the price chart, along with the irrefutable "NoGo" signal in the main price panel.

Foundational concepts like this are crystal clear to the user of GoNoGo Charts because of the simplicity and clarity of the information presented. GoNoGo Charts are applicable to any security, across all asset classes, and like all technical tools they are fractal in nature – meaning they provide the same information on any timeframe or periodicity. Click here for a complete explanation of the mechanics of GoNoGo Charts.

GONOGO OSCILLATOR AND THE ZERO LINE

Traditional momentum oscillators were designed to identify extremes in velocity of price movement. Many innovators of the 1970s developed oscillators for use in the rangebound US equity markets to identify peaks and troughs, often called "overbought" and "oversold" levels, to identify likely points of mean-reversion. GoNoGo Oscillator, which blends inputs from several popular oscillators, can certainly be used in this way.

Much research has been published, however, around applying momentum oscillators to *trending* markets. The literature tells us that, when a security is in trend, oscillators move in a range, they do not swing from one extreme to the other. For example, when in an uptrend, RSI will often move between overbought highs around 80 down to levels around 40. But while the uptrend continues, RSI will not drop to overbought levels. Knowing this, investors can try to find a level of *support* for the oscillator itself. The problem is these levels are subjective and vary from trend to trend and from security to security.

The unique way in which GoNoGo Oscillator interacts with the zero-line is perhaps the most useful feature for trend-followers. GoNoGo Oscillator is calculated in such a way that when the blend of momentum calculations falls into their neutral zones the oscillator value drops to zero. The zero-line is a stable depiction of a varying neutral reading, giving the user an objective view of any diverging momentum break from the trend.

The interaction was designed so that, during a healthy "Go" trend, the oscillator can rise to extremes and drop to zero repeatedly as price surges and consolidates. It should not fall into negative territory during a healthy uptrend, however, as that would signal an oversold condition often leading to trend reversal. If the trend is healthy it will bounce off the zero-line indicating trend continuation. At these points a GoNoGo Chart alerts users to the renewed momentum in the direction of the trend with green re-entry icons.

One of the most difficult behavioral elements of trend-following investment strategies is staying in a trade that has always posted strong gains. "Let your winners run" is simple advice, but very difficult to execute. Within established "Go" trends, each time the oscillator bounces off the zero line provides an opportunity to add to positions and increase leverage helping investors maximize returns with conviction in the trend.

More importantly, from a risk-management perspective, users observe that the first time GoNoGo Oscillator fails to hold the zero line as support/resistance there is significant weakness in the trend conditions. A break of the zero-line will often precede a change in color for the price bars in the main panel.

A clear example of this is depicted in the daily GoNoGo chart below of the $QQQ. A "Go" trend is identified in early November and white arrows were added each time GoNoGo Oscillator finds support at the zero line. As the trend starts to deteriorate in mid-February, we can see that for the first time

GoNoGo Oscillator is unable to find support at the zero line. What follows is a change in the overall condition of the blended trend indicators. The bars change to the neutral amber color before identifying a complete trend reversal, signaling the “NoGo” flag and a move to pink, then purple bars.

Now that you understand what is embedded in the tools and how they are constructed, we can discuss the application of these tools for investors navigating the tumultuous markets of the past 20 months.

THE VOLATILITY OF THE MARKETS IN 2020

Considering the dramatic and unprecedented moves of 2020, the daily GoNoGo chart above of the S&P 500 ($SPY) offers a prime example of how the charts deliver signal, not noise. GoNoGo Trend in the upper price panel was able to highlight the change in trend quickly last February. The indication of an amber bar combined with the diverging oscillator showed investors that the prior bullish "Go" trend had neutralized. The immediate follow-up of a "NoGo" flag signaled the reversal of price trend in the $SPY.

This explicit signal was not at the absolute peak price, but rather at the start of the impending crash. The purple (most bearish) and pink (bearish) bars continued to reinforce the "NoGo" technical environment for the index throughout the historically rapid decline which persisted through the end of March. GoNoGo Charts provide equally clear trend information to the downside. Confirmed by GoNoGo Oscillator which remained below zero, a low-risk entry for shorting the index was indicated by the red circle icon in early March.

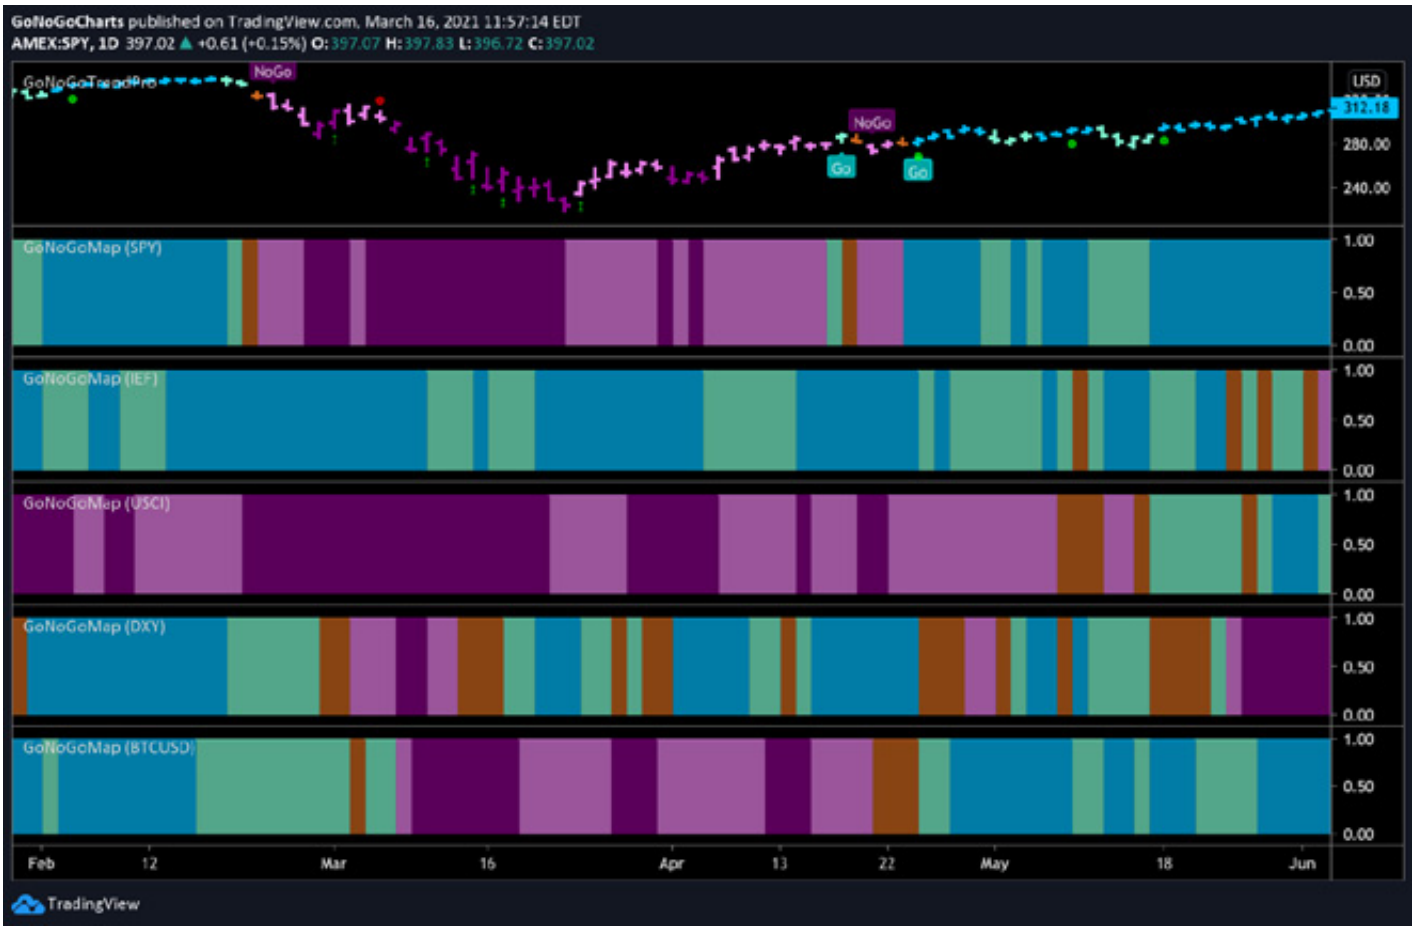

Having hit the low of 2237.4 on March 23rd, we see the GoNoGo Oscillator® ride the zero line into the beginning of April. Reduced momentum and decreasing volatility are highlighted by the white climbing grid of the GoNoGo Squeeze® in the oscillator panel. This indicator captures the prolonged stagnation of a suspended market – where neither buyers nor sellers have control. The longer momentum stays

neutral, the more prolonged the squeeze. Like a coiled spring, low-volatility periods are often followed by a breakout with strong momentum.

As GoNoGo Oscillator broke out of the squeeze, showing positive momentum, it led the color change in GoNoGo Trend and a rally out of the lows ensued (highlighted by the white arrow). As the rally continued into the 2nd quarter of 2020, the "Go" trend persisted with renewed momentum. The oscillator found support at the zero-line, repeatedly signaling low-risk reentries to give investors conviction in the rally.

SAFE HAVEN ASSETS

Not every investor can simply exit the market or raise cash during a crash. Many portfolio managers' mandate requires they stay fully invested. While the tools highlighted above offer clear indications for market entry and exit, GoNoGo Charts also deliver a succinct visual tool for understanding correlation and relative strength trends. Allocations to safe haven asset classes, sectors, or securities can be made with confidence using other GoNoGo Charts visual tools.

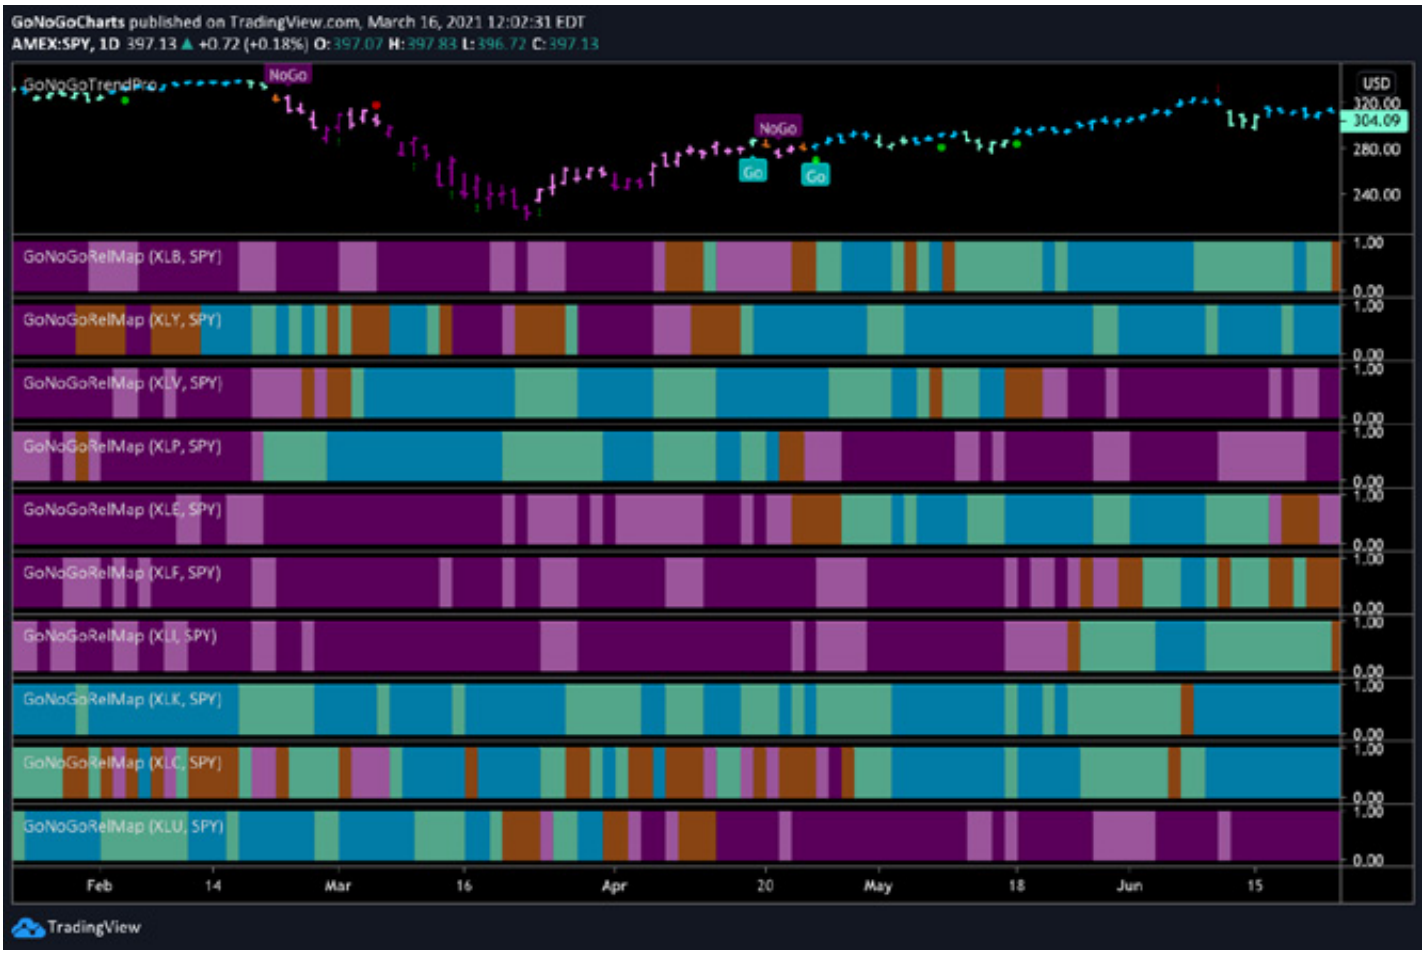

The GoNoGo Heat Map® above displays a comparison between all five major asset classes. Using the GoNoGo Trend calculations, investors can see the trend conditions in isolation.

- The top frame above the heat map shows the GoNoGo Trend for $SPX. The first panel in the heat map shows global equities using $DGT, the Global Dow ETF.
- One clear alternative to equities during the meltdown in March 2020 was US Treasuries, represented in the second panel by $IEF (I-shares 7-10 year treasury fund). Treasuries were in a blue/aqua "Go" trend through the tumultuous period concluding in June.
- GoNoGo Heat Map clearly shows that commodities, in the third panel, were in a "NoGo" trend from early 2020. However, $USCI emerged into an aqua and blue "Go" trend beginning in mid-May following the equity rally.
- The fourth map panel shows the US dollar, indexed against a basket of major currencies. The US dollar, $DXY, showed strength during the drawdown in stocks as investors fled the markets.
- The final map panel shows the world's largest digital asset, Bitcoin, and even this cryptocurrency took a hit during the coronavirus meltdown.

The chart provides a macro view across asset classes, alerting investors to the markets which are trending and quickly demonstrates the power of allocating capital among non-correlated assets.

SECTOR PERFORMANCE

For investors who exclusively trade stocks but need to stay fully invested, there were opportunities for better performance *relative* to the broad index during the 2020 crash. Meaning, some areas of the market had smaller drawdowns than the market as a whole.

The chart above is a GoNoGo RelMap®. This unique heat map shows the GoNoGo Trend colors of each sector's *relative strength ratio* against the S&P 500. These panels do not represent the absolute trend of the sectors – they all declined during the crash – but rather the trend of their performance against the benchmark.

As you might have expected based on the asset class analysis, defensive sectors outperformed the overall market during the downturn. Look at Utilities, $XLU, in the lowest panel and how it sustained an aqua and blue "Go" trend through the lows in March. Consumer Staples, $XLP (4th panel), also came into a positive *relative* trend; outperforming the index right as the market rolled over. Healthcare, $XLV (3rd panel), started to outperform in early March as headlines made clear that a race for a Covid-19 vaccine was underway.

As the market rallied, you can see that the *relative performance* of those defensive sectors succumbed to "NoGo" trends as a rotation into new sectors led the recovery. Look at Energy, $XLE (5th map panel), and Consumer Discretionary, $XLY (2nd map panel). Both sectors underperformed on a relative basis during the market crash but have been in strong "Go" relative trends since late April.

Finally, the Technology and Communications sectors outperformed the index on a relative basis as unified efforts to quarantine the spread of the global pandemic through "stay-at-home" orders stimulated demand for products and services in these sectors. The relative ratio of the Technology sector to the S&P 500, $XLK/SPX, led the markets in a "Go" trend through the historic crash and rebound.

ASSESSING RISK EVERYDAY, NOT JUST DURING A CRISIS

The chart below shows how an investor could understand the environment for risk during the pandemic, or at any point they would want to understand the broad context of risk in capital markets.

The lower panel is a modified GoNoGo Map called GoNoGo Risk®. This map shows the GoNoGo Trend applied to a risk proxy. In this instance, GoNoGo Charts uses the relative ratio of high yield bonds to treasuries, a common risk proxy. When allocations to "junk" bonds outpace allocations to government treasury bonds, investors are seeking yield through riskier assets – indicating a "risk-on" environment for investors.

Interestingly, the environment was getting *riskier* as early as the end of January. GoNoGo Risk became neutral amber for three bars before entering a "NoGo" weeks before the market collapsed. From a macro risk perspective, the chart provided a leading indicator of the sell-off ahead beginning in late January. Investors of all stripes, and technical analysts in particular, look for multiple points of confirmation to assure the highest probability of success. While the ratio of high yield bonds to treasuries is not a trading signal for any given security, it provides important context for regime shift in the markets.

GoNoGo Risk lagged many reentry points for the recent market rally and should not be used as a trading tool, investors will note that currently the indicator confirms markets are in a *risk-on* environment.

WHERE ARE WE NOW?

Having explained how the GoNoGo Charts helped analyze the market during the unprecedented fall and rise in 2020, look at the GoNoGo Chart below of the S&P 500 Spydr ETF to assess the current technical environment. A daily GoNoGo Trend and GoNoGo Oscillator of the $SPY clearly show a "Go" with price making higher highs and higher lows. The volatility causing the recent correction in the S&P was enough to trigger an amber "*Go Fish*" bar, signaling a lack of directional trend, but was not enough to push the $SPY into a "NoGo". While GoNoGo Oscillator briefly dipped negative it quickly bounced back into positive territory which caused the most recent green low-risk entry icon to appear under the price bar, reassuring investors that the environment for equities is firmly a "Go" for launch.

STILL ABOARD THE ARK?

The overall market trend is a “Go” but we have seen rotation between sectors and among stock types. With the recent shift away from mega-cap technology names toward cyclical sectors and value stocks, let us look at how GoNoGo Charts illuminated the changing technical environment for Ark Investment’s Innovation ETF, $ARKK.

We see in the chart below that there was a renewed “Go” trend identified in November of 2020 as the GoNoGo Oscillator broke out of a Squeeze to the upside. During that strong “Go” trend, several low-risk entry icons signaled trend continuation points (green circles). When GoNoGo Oscillator was finally unable to find support at zero GoNoGo Trend also fell out of the “Go” trend as it broke through a trend line. Now in the established “NoGo” trend, we see how GoNoGo Oscillator is finding resistance at the zero line. Currently at zero, we will watch to see if it is turned away again.

BELIEVE IN BITCOIN

Surely one of the most exciting trends of the last year is Bitcoin, the world's largest digital asset. The daily chart below shows that the most recent "Go" trend was identified in October of 2020 at around $11,000. Since then, the trend has been continuously reconfirmed by GoNoGo Oscillator as it continues to bounce off the zero line, providing low risk entry points. After the most recent of these, we saw price push higher to briefly trade above $60,000. As of March 15th, GoNoGo Oscillator is testing the zero line once more from above, where we will look to see if it finds support, and in doing so, provide another trend continuation icon on the price chart as $BTCUSD attempts to move higher yet again.

LEARN MORE

GoNoGo Charts® suite of technical tools give investors a complete understanding of market events and price action. Trend, momentum, volume, and volatility are all captured in elegant, simplified visual tools. Investors can also glean comparative asset class and sector performance on an absolute or relative basis,

while keeping an eye on market risk. To learn more about GoNoGo Charts, or to initiate a free trial of GoNoGo Research, please visit www.gonogocharts.com.

GoNoGo Charts were meticulously developed over years to equip institutional asset managers, traders, and analysts with simple to read measurements about whether the market environment is a "Go" for launch. They are now available to individual investors through WealthCharts® and TradingView®.

Why "GoNoGo" Charts?

The "Go/No-Go" terminology is borrowed from a type of pass/fail testing system often used by NASA as a launch status check. In the early stages of developing these tools, that metaphor had striking similarities to the disciplined process of investing.

Uncertainty in the market is unavoidable, but for every trade decision where capital is at risk, making sure you have confirmation from multiple measurements that conditions are right gives you the highest probability of success.

GoNoGo Charts | About Us

CEO & CHIEF MARKET STRATEGIST

ALEX COLE

Alex Cole is a market analyst and software developer. Over the past 15 years, Alex has led technical analysis and data visualization teams, directing both business strategy and product development of analytics tools for investment professionals.

As an analyst, Alex has frequently contributed to financial news industry organizations such as Bloomberg and Benzinga. He has delivered presentations to the members of the CMT Association in the US and internationally including the 44th Annual CMT Symposium in NYC and the 2020 India Investment Summit. In addition, Alex has provided multiple workshops based on the GoNoGo Charts suite of indicators as part of the CMT's educational webinar series.

Alex has created and implemented training programs for large corporations and for private clients. His teaching covers a wide breadth of Technical Analysis subjects from introductory to advanced trading strategies. In addition, Alex serves as the lead instructor and subject matter expert for John Wiley and Son's Efficient Learning division. Alex was responsible for creating instructor materials and video lectures for a complete educational course designed to prepare candidates for the CMT Program.

Alex earned his MA in English Literature and an MBA in Global Management from Fairleigh Dickinson University.

CHIEF OPERATING OFFICER

TYLER WOOD

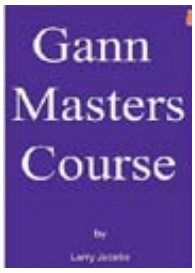

Tyler Wood is a seasoned business executive who has led the operational and business development activities of teams large and small. As an executive manager over the past 20 years, he built and brought products to market in the educational technology space and financial services industry.

As the Managing Director of the CMT Association for over a decade, Tyler has presented the tools of technical analysis around the world to investment firms, regulators, exchanges, and broker-dealers. Galvanizing vendors, volunteers, and demanding stakeholders around a common vision, Tyler designed and implemented policies and programming that raised the standards for professional technical analysis worldwide.

Throughout his career, Tyler has managed product development, brand communications, technology, and sales teams to drive top-line revenue growth and customer satisfaction for public, private, and non-profit entities. Prior to joining the CMT Association, Tyler worked in management consulting and publishing.

Tyler graduated from Macalester College and received his MBA from the Kelley School of Business at Indiana University.

Amazon Kindle Books

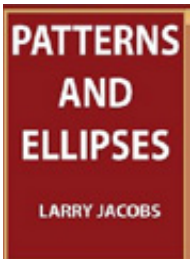

Gann Masters Course by Larry Jacobs $9.95

As you know, W.D. Gann was a legendary trader. Some say he amassed a fortune in the the markets. He wrote several important books on trading as well as a commodity trading course and a stock market trading course. He charged $3000 to $5000 for the trading courses which included 6 months of personal instruction by phone. The Gann Masters Trading Course to help traders become successful.

A Unique Approach to Forecasting by Ivan Sargent $32.95

This book is possibly one of most advanced books in technical analysis you will read regarding price and time reversals. Knowing the Price and time of a stocks reversal point is undeniably an important element for to successful trading. Unlike most trading books which use indicators, oscillators, and basic geometry to forecast the markets outcome; this technique uses a series of lines which when accurately placed can deliver reversal points with amazing accuracy. Trend lines, retracements lines, channels, fan lines, pivot points etc, all inspect a stock chart from the outside, which is more or less the obvious point of view.

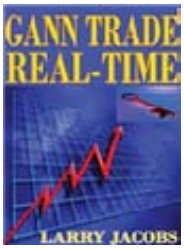

Patterns and Ellipses by Larry Jacobs $9.99

This book concerns itself with a highly technical subject, the subject of technical analysis of the financial market. This book specifically deals with ellipses and pattern formations used for trading the markets. It also covers many other technical analysis tools that can be used effectively by the trader.

Gann's Master Charts Unveiled by Larry Jacobs $9.99

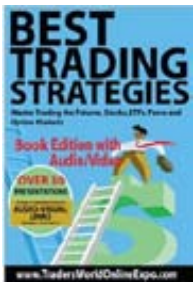

We know that Gann used the Pythagorean Square because he was found carrying it with him into the trading pit all the time. This square was hidden in the palm of his hand. How did he use this square? Why did he not discuss the use of this square in his courses? There is only one page covering the Square of Nine in all of his books and courses. Was this square his most valuable tool? These and all the other squares Gann used will be discussed in detail in this book with many illustns and examples to prove how they work.

Gann Trade Real Time by Larry Jacobs $9.99

When you opened this book you took the one step that will help you learn how to be successful at the most desirable, but hardest profession in the world. That profession is real time trading. This book is not going to give you an instant secret to day trading. It is going to give you the basics so that you might start the path to understanding how the markets work both short term and long term. You need to know and fully understand the markets and develop successful trading

strategies to become successful at this endeavor.

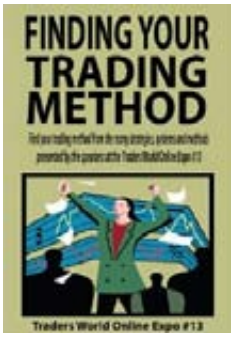

Best Trading Strategies: Master Trading the Futures, Stocks, ETFs, Forex and Option Markets $3.99

This is one of the most fascinating books that was ever written about trading because it is written by over thirty expert traders. These traders have many years of experience and they have learned how to turn technical analysis into profits in the markets. This is extremely difficult to do and if you have ever tried to trade the markets with technical analysis you would know what I mean. These writers have some of the best trading strategies they use and have the conviction and the discipline to act assertively and pull the buy or sell trigger regardless of pressures they have against them. They have presented these strategies at the Traders World Online Expo #14 in video presentations and in this book.

What sets these traders apart from other traders? Many think that beating the markets has something to do with discovering and using some secret formula. The traders in this book have the right attitude and many employ a combination of fundamental analysis, technical analysis principles and formulas in their best trading strategies.

Trading is one of the best ways to make a lot of money in the world if one does it right. One needs to find successful trading strategies and implement them in their own trading method. The purpose of this book is to present to you the best trading strategies of these traders so that you might be able to select those that fit you best and then implement them into your own trading.

I wish to express my appreciation to all the writers in this book who made the book possible. They have spent many hours of their time and hard work in writing their section of the book and the putting together their video presentation for the online expo.

Finding Your Trading Method $3.99

Finding your trading method is the main problem you need to solve if you want to become a successful trader. You may be asking yourself, can I find my own trading method that will reflect my own personality toward trading? For example, do you have the patience to sit in front of a computer and trade all day? Do you prefer to swing trade from 3-5 days or do you like to hold positions for weeks and even months? Every trader is different. You need to find your own trading method.

Finding out your trading method is extremely important to produce a profitable benchmark that can be replicated in your live account. Perhaps the best way to find a successful trading method is to listen to many expert traders to understand what they have done to be successful. The best way to do that is to listen to the Traders World Online Expos presentations. This book duplicates what these experts have said in their presentations,

which explains what they have done to find their own trading method.

If you have a trading method that gives you a predictable profit, then that type of objectivity contributes to your trading edge. The problem with most traders is that being inconsistent will never allow them to have an edge. After you find your trading method that you feel comfortable with, you must have the following:

An overall plan to:
1) Set your rule set and plan and then stick with it in all of your trading.
2) To give you a trading plan for every day.

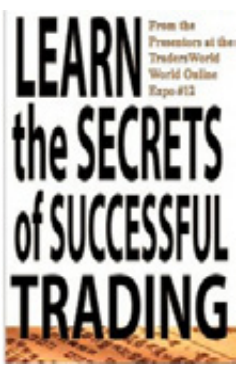

The trade plan then should:
1) Have an exact entry price
2) Have a stop price
3) Have a way to add positions
4) Tell you where to take profits
5) Have a way to protect your profits

By reviewing all the methods given in this book by the expert traders, it will give, you the preliminary steps that you need to find your footing in finding your own trading method.

Reading this book and by seeing the actual recorded presentations on the Traders World Online Expo site can act as a reference tool for selecting your method of trading, investment strategies and tactics.

It took many of these expert traders in this book 15 – 30 years to finally come up and find the answers to find their trading method to make consistent profit. Finding your trading method could be then much easier when you read this book and incorporate the techniques that best fit your personality and style from these traders. This book will enable you to that fastest way to do that.

So if you want help to find your own trading method to be successful in the markets then buy and read this book.

Learn the Secrets of Successful Trading $3.99

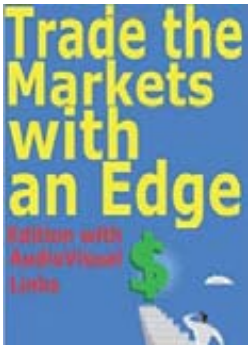

Learn specific trading strategies to improve your trading, learn trading ideas and tactics to be more profitable, better optimize your trading system, find the fatal flaws in your trading, understand and use Elliott Wave to strengthen your trading, position using correct sizing to trade more profitable, understand Mercury cycles in trading the S&P, get consistently profitable trade setups, reduce risk and increase profits using volume, detect and trade the hidden market cycles, short term trading by taking the money and running, develop your mind for trading, overcoming Fear in

Trading, trade with the smart money following volume, understand and use the Ultimate Oscillator, use high power trading with geometry, get better entries, understand the three legs to trading, use technical analysis with NinjaTrader 7, use a breakout system with cycles for greater returns with less risk, use TurnSignal for better entries and exits, trade with an edge, use options profitably, learn to trade online, map supply and demand on charts, quantify and execute portfolio rotation for auto trading.

Written by Many Expert Traders

The book was written by a large group of 35 expert traders, with high qualifications, most of who trade professionally and/or offer trading services and expensive courses to their clients. Some of them charge thousands of dollars per day for personal trading! These expert traders give generally 45-minute presentations covering the same topics given in this book at the Traders World Online Expo #12. By combining their talents in this book, they introduce a new dimension to finding a profitable trading edge in the market. You can use ideas and techniques of this group of experts to leverage your ability to find an edge to successfully trade. Using a group of experts in this manner to insure your trading success is unprecedented.

You'll never find a book like this anywhere! This unique trading book will help you uncover the underlying reasons for your lack of consistency in trading and will help you overcome poor habits that cost you money in trading. It will help you to expose the myths of the market one by one teaching you the right way to trade and to understand the realities of risk and to be comfortable with trading with market. The book is priceless!

Trade the Markets with and Edge $3.99

This is an important book discussing the use of different strategies methods about trading.

It was written by over 30 expert traders. The book was designed to help you develop your own trading edge in the markets to put you above others who don't have an edge and just trade by the seat of their pants. 90% of traders actually lose in the markets and the main reason is simply that they don't have an edge.

All of the writers in this book are very experienced and knowledgeable of different ways. Each of them has their own expertise in trading the markets. What sets these traders apart from other traders? Many think that beating the markets has something to do with discovering and using some secret formula.

The traders in this book have the right attitude and many employ a combination of fundamental analysis, technical analysis principles and formulas in their best trading strategies. This gives

them a trading edge over other traders. If you want to be successful at trading, you too must have your edge. One needs to find successful trading strategies and implement them in their own trading method.

The purpose of this book is to present to you the best trading strategies of these traders so that you might be able to select those that fit you best and then implement them into your own trading style. I wish to express my appreciation to all the writers in this book who made the book possible. They have spent many hours of their time and hard work in writing their section of the book and the putting together their video presentation for the online expo.

Guide to Successful Online Trading - Secrets from the Pros $3.99

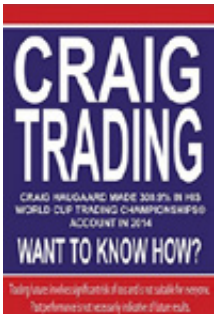

This is one of the finest trading books you'll ever see about trading. The reason is that it comes from a group of expert pro traders with multiple years of experience.

CRAIG TRADING: Craig Haugaard made 300.9% in his World Cup Trading Championships® Account in 2014 - Want to Know How? $3.99

This book contains an interview that I made with Craig Haugaard, third-place finisher in the 2014 World Cup Championship of Futures Trading® with a 300.9% net profit. I asked him many questions on exactly how he did it.
In the rest of the book I explain to you how to use the indicators that Craig used to make his 300.9% return.
Here are the indicators that he used:

- Seasonality
- MACD
- Stochastics
- Moving Averages
- Trailing Stops
- Fibonacci Retracements & Extensions

All of the charts in this book are produced using my favorite charting software Market-Analyst®. I have also arranged for you to get a FREE trial so that you might have the chance to actually work with these indicators with a real charting platform.
You will also be able to view the video presentations that I personally created so you can see how these indicators can be setup and followed with clear and concise step-by-step instructions. After you understand how these indicators work, I would then recommend that you go to WorldCupAdvisor.com and consider following Craig Haugaard's real-time trades.

This one-of-a-kind book teaches you how to identify the direction of the markets and trade the markets by using popular trading indicators. This is done by concise instructions backed by learning videos, hands on practice with real trading software and by following real-time trades of a master trader.

This book is an enhanced Edition which means that the articles are backed with audio visual presentation links. Most of the presentations are in HD quality and are put together by the writers of the articles in the book and really help the learning process.

Successful trading is based on knowledge and having the right psychology to trade the markets. This book will lift your trading to a much higher level and will save you an enormous amount to time.

Trading with Success $4.99

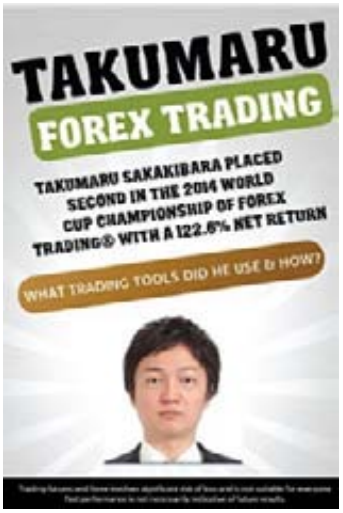

This book contains an interview in Chapter 1 with Rob Mitchell, who finished in 2nd place in the 2014 World Cup Championship® of CME E-mini Trading with a 57% net profit.

Rob Mitchell is the president of Axiom Research & Trading, Inc. and has been a trading system developer for over 20 years and has developed a number of commercially successful trading systems. He has at various times been the largest eMini S&P trader in the world. Rob has also acted as a Commodity Trading Adviser, has traded for hedge funds and has won the Robbins World Cup eMini trading championship in the past. Rob is a trading teacher and mentor and is the founder and head trader of Oil Trading Room which is devoted to providing advanced educational resources to traders at all levels.

In the rest of the book I will explain to you some of the trading ideas of Rob that he uses in both his Oil Trading Room and in his World Cup Advisor Account. You can then actually see and understand how some of his ideas work.

I am not going to tell you exactly how Rob used the ideas to make his return of 57% on a $10,000 investment. That information is not public and belongs only to Rob.

I will tell you some of the trading ideas he uses and help you understand how these ideas work. I would then recommend that you go to World Cup Advisor and consider following Rob's trades. You will be able to automatically mirror Rob's trades in your own brokerage account with World Cup Leader-Follower AutoTrade™ service. You will also be able to see what his trades look like on your own charts and better understand why he made the trades.

Takumaru Forex Trading $4.99

This book contains an interview in Chapter 1 with Takumaru Sakakibara, who finished in 2nd place in the 2014 World Cup Championship of Forex Trading® with a 122.6% net profit. "Takumaru's largest drawdown (cumulative peak-to-valley percentage decline in month-end net equity during the life of the account) was -21.5% from 6-30-15 to 10-31-15."

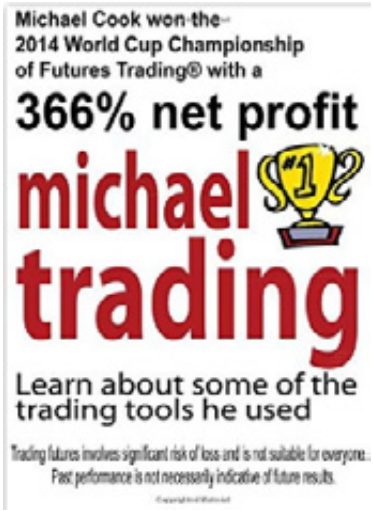

"Please remember that past performance is not necessarily indicative of future results."

"Please remember that Forex trading involves substantial risk of loss, and past performance is not necessarily indicative of future results."

In the rest of the book I will explain to you some of the trading ideas Takumaru said he used in

the championship. You can then actually see and understand how his ideas work.

I am not going to tell you exactly how Takumaru used the ideas to make his return of 122.6% on a $10,000 investment. That information is not public and belongs only to Takumaru.

I will tell you which indicators he used and help you understand how these indicators work.

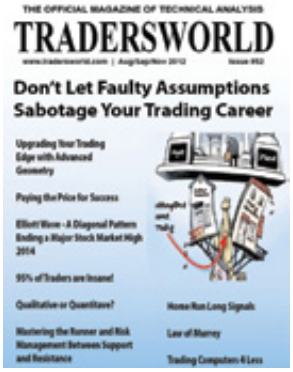

Michael Trading: Learn about some of the trading tools he used $4.99

Michael Cook, was the first-place finisher in the 2014 WORLD CUP Championship of Futures Trading® with a 366% net profit. In this book there is a detailed interview with Michael with questions and answers of exactly what he used to win the championship. In this book I will explain to you the indicators that he said he used in the interview. You can then actually see and understand how they work. Here are some the indicators and methods that he said he used: 1) Moving Averages 2) Seasonality 3) Cycles 4) Seasonality 5) Price Patterns 6) William's %R 7) Long with Stops 8) Commitment of Traders Report You will also be able to download a video presentation that I personally created so you can see how these indicators can be setup and followed in a step-by-step manner. After you understand how these indicators work, I would then recommend that you go to WorldCupAdvisor.com and consider following Michael Cook's trades.
